## 125 **1 Scope**

126 This document specifies a framework for translation between OCF Devices and other ecosystems,  
127 and specifies the behaviour of a translator that exposes servers in non-OCF ecosystem to OCF  
128 Clients and/or exposes OCF Servers to clients in non-OCF ecosystem. Translation per specific  
129 Device is left to other specification (deep translation). This document provides generic  
130 requirements that apply unless overridden by a more specific document.

## 131 **2 Normative references**

### 174 **3 Terms, definitions, and abbreviated terms**

#### 175 **3.1 Terms and definitions**

176 For the purposes of this document, the terms and definitions given in ISO/IEC 30118-1:2018 and  
177 the following apply.

178 ISO and IEC maintain terminological databases for use in standardization at the following  
179 addresses:

- 180 – ISO Online browsing platform: available at <https://www.iso.org/obp>
- 181 – IEC Electropedia: available at <http://www.electropedia.org/>

##### 182 **3.1.1**

#### 183 **Asymmetric Client Bridge**

184 an asymmetric client bridge exposes another ecosystem clients into the OCF ecosystem as Virtual  
185 OCF Clients (3.1.20). This is equivalent to exposing OCF Servers (3.1.15) into the other ecosystem.  
186 How this is handled in each ecosystem is specified on a per ecosystem basis in this document.

##### 187 **3.1.2**

#### 188 **Asymmetric Server Bridge**

189 an asymmetric server bridge exposes another ecosystem devices into the OCF ecosystem as  
190 Virtual OCF Servers (3.1.23). How this is handled in each ecosystem is specified on a per  
191 ecosystem basis in this document.

##### 192 **3.1.3**

#### 193 **Bridged Client**

194 logical entity that accesses data via a Bridged Protocol (3.1.5). For example, an AllJoyn Consumer  
195 application is a Bridged Client

##### 196 **3.1.4**

#### 197 **Bridged Device**

198 Bridged Client (3.1.3) or Bridged Server (3.1.8).

##### 199 **3.1.5**

#### 200 **Bridged Protocol**

201 another protocol (e.g., AllJoyn) that is being translated to or from OCF protocols

##### 202 **3.1.6**

#### 203 **Bridged Resource**

204 represents an artefact modelled and exposed by a Bridged Protocol (3.1.5), for example an AllJoyn  
205 object is a Bridged Resource.

##### 206 **3.1.7**

#### 207 **Bridged Resource Type**

208 schema used with a Bridged Protocol (3.1.5), for example AllJoyn Interfaces are Bridged Resource  
209 Types.

210

211 **3.1.8 Bridged Server**  
212 logical entity that provides data via a Bridged Protocol (3.1.5), for example an AllJoyn Producer is  
213 a Bridged Server. More than one Bridged Server can exist on the same physical platform.

214 **3.1.9**  
215 **OCF Bridge Device**  
216 OCF Device (3.1.11) that can represent devices that exist on the network but communicate using  
217 a Bridged Protocol (3.1.5) rather than OCF protocols.

218 **3.1.10**  
219 **OCF Client**  
220 logical entity that accesses an OCF Resource (3.1.12) on an OCF Server (3.1.15), which might be  
221 a Virtual OCF Server (3.1.23) exposed by the OCF Bridge Device (3.1.9)

222 **3.1.11**  
223 **OCF Device**  
224 logical entity that assumes one or more OCF roles (OCF Client (3.1.10), OCF Server (3.1.15)). More  
225 than one OCF Device can exist on the same physical platform.

226 **3.1.12**  
227 **OCF Resource**  
228 represents an artefact modelled and exposed by the OCF Framework

229 **3.1.13**  
230 **OCF Resource Property**  
231 significant aspect or notion including metadata that is exposed through the OCF Resource (3.1.12)

232 **3.1.14**  
233 **OCF Resource Type**  
234 OCF Resource Property (3.1.13) that represents the data type definition for the OCF Resource  
235 (3.1.12)

236 **3.1.15**  
237 **OCF Server**  
238 logical entity with the role of providing resource state information and allowing remote control of its  
239 resources

240 **3.1.16**  
241 **Symmetric, Asymmetric Bridging**  
242 in symmetric bridging, a bridge device exposes OCF Server(s) (3.1.15) to another ecosystem and  
243 exposes other ecosystem's server(s) to OCF. In asymmetric bridging, a bridge device exposes  
244 OCF Server(s) (3.1.15) to another ecosystem or exposes another ecosystem's server(s) to OCF,  
245 but not both.

246 **3.1.17**  
247 **Translator**  
248 OCF Bridge Device (3.1.9) component that is responsible for translating to or from a specific  
249 Bridged Protocol (3.1.5). More than one translator can exist on the same OCF Bridge Device (3.1.9),  
250 for different Bridged Protocols (3.1.5).

251 **3.1.18**  
252 **Virtual Bridged Client**  
253 logical representation of an OCF Client (3.1.10), which an OCF Bridge Device (3.1.9) exposes to  
254 Bridged Servers (3.1.8).

255 **3.1.19**  
256 **Virtual Bridged Server**  
257 logical representation of an OCF Server (3.1.15), which an OCF Bridge Device (3.1.9) exposes to  
258 Bridged Clients (3.1.3).

259 **3.1.20**  
260 **Virtual OCF Client**  
261 logical representation of a Bridged Client (3.1.3), which an OCF Bridge Device (3.1.9) exposes to  
262 OCF Servers (3.1.15)

263 **3.1.21**  
264 **Virtual OCF Device**  
265 Virtual OCF Client (3.1.20) or Virtual OCF Server (3.1.23).

266 **3.1.22**  
267 **Virtual OCF Resource**  
268 logical representation of a Bridged Resource (3.1.6), which an OCF Bridge Device (3.1.9) exposes  
269 to OCF Clients (3.1.10)

270 **3.1.23**  
271 **Virtual OCF Server**  
272 logical representation of a Bridged Server (3.1.8), which an OCF Bridge Device (3.1.9) exposes to  
273 OCF Clients (3.1.10).

## 274 **3.2 Abbreviated terms**

275 **3.2.1**  
276 **CRUDN**  
277 Create, Read, Update, Delete, and Notify

278 **3.2.2**  
279 **CSV**  
280 Comma separated value

281

## 282 4 Document conventions and organization

### 283 4.1 Conventions

284 In this document a number of terms, conditions, mechanisms, sequences, parameters, events,  
285 states, or similar terms are printed with the first letter of each word in uppercase and the rest  
286 lowercase (e.g., Network Architecture). Any lowercase uses of these words have the normal  
287 technical English meaning

### 288 4.2 Notation

289 In this document, features are described as required, recommended, allowed or DEPRECATED as  
290 follows:

291 Required (or shall or mandatory).

- 292 – These basic features shall be implemented to comply with OIC Core Architecture. The phrases  
293 “shall not”, and “PROHIBITED” indicate behaviour that is prohibited, i.e. that if performed means  
294 the implementation is not in compliance.

295 Recommended (or should).

- 296 – These features add functionality supported by OIC Core Architecture and should be  
297 implemented. Recommended features take advantage of the capabilities OIC Core Architecture,  
298 usually without imposing major increase of complexity. Notice that for compliance testing, if a  
299 recommended feature is implemented, it shall meet the specified requirements to be in  
300 compliance with these guidelines. Some recommended features could become requirements in  
301 the future. The phrase “should not” indicates behaviour that is permitted but not recommended.

302 Allowed (or allowed).

- 303 – These features are neither required nor recommended by OIC Core Architecture, but if the  
304 feature is implemented, it shall meet the specified requirements to be in compliance with these  
305 guidelines.

- 306 – Conditionally allowed (CA)The definition or behaviour depends on a condition. If the specified  
307 condition is met, then the definition or behaviour is allowed, otherwise it is not allowed.

308 Conditionally required (CR)

- 309 – The definition or behaviour depends on a condition. If the specified condition is met, then the  
310 definition or behaviour is required. Otherwise the definition or behaviour is allowed as default  
311 unless specifically defined as not allowed.

312 DEPRECATED

- 313 – Although these features are still described in this document, they should not be implemented  
314 except for backward compatibility. The occurrence of a deprecated feature during operation of  
315 an implementation compliant with the current document has no effect on the implementation’s  
316 operation and does not produce any error conditions. Backward compatibility may require that  
317 a feature is implemented and functions as specified but it shall never be used by  
318 implementations compliant with this document.

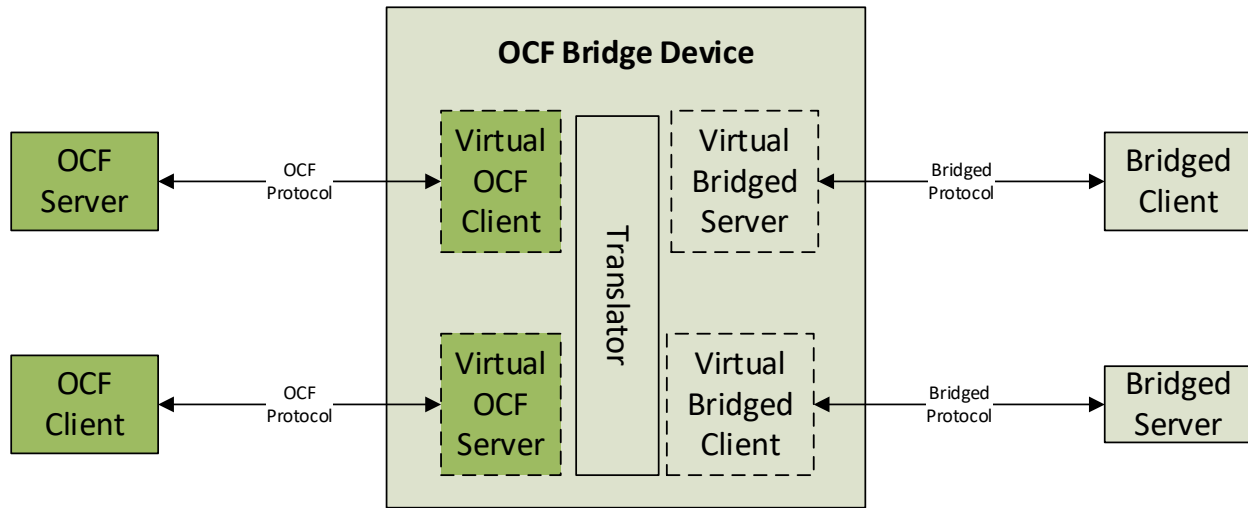

319 Strings that are to be taken literally are enclosed in “double quotes”.

320 Words that are emphasized are printed in *italic*.

321 **5 OCF Bridge device**

322 **5.1 Introduction**

323 This clause describes the functionality of an OCF Bridge Device; such a device is illustrated in  
324 Figure 1.

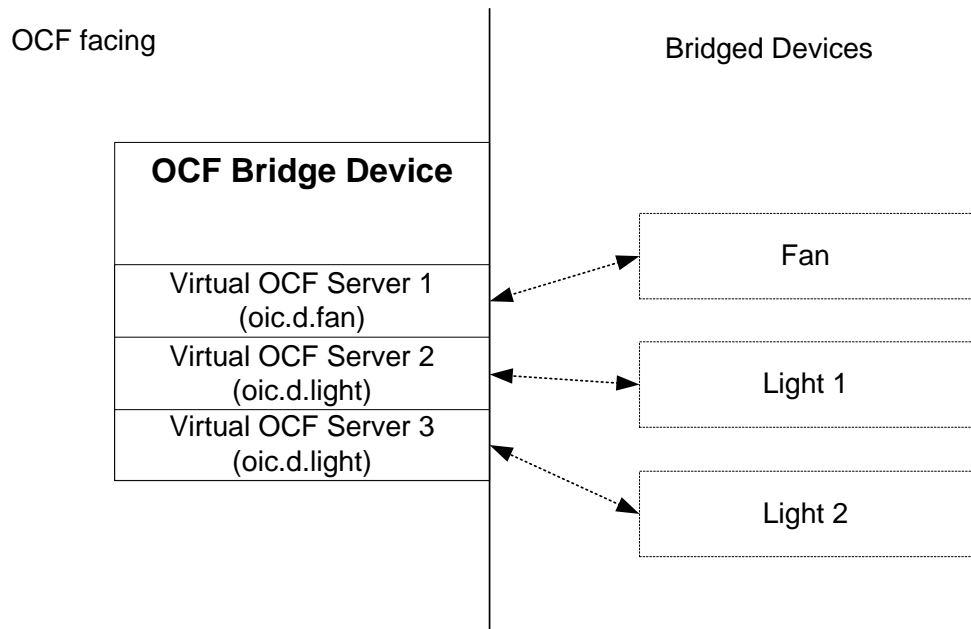

325

326

**Figure 1 – OCF Bridge Device components**

327 An OCF Bridge Device is a device that represents one or more Bridged Devices as Virtual OCF  
328 Devices on the network and/or represents one or more OCF Devices as Virtual Devices using  
329 another protocol on the network. The Bridged Devices themselves are out of the scope of this  
330 document. The only difference between a native OCF Device and a Virtual Bridged Device is how  
331 the device is encapsulated in an OCF Bridge Device.

332 An OCF Bridge Device shall be indicated on the OCF Security Domain with a Device Type of  
333 "oic.d.bridge". This provides to an OCF Client an explicit indication that the discovered Device is  
334 performing a bridging function. This is useful for several reasons; 1) when establishing a home  
335 network, the Client can determine that the bridge is reachable and functional when no bridged  
336 devices are present, 2) allows for specific actions to be performed on the bridge considering the  
337 known functionality a bridge supports, 3) allows for explicit discovery of all devices that are serving  
338 a bridging function which benefits trouble shooting and maintenance actions on behalf of a user.  
339 When such a device is discovered the exposed Resources on the OCF Bridge Device describe  
340 other devices. For example, as shown in Figure 2.

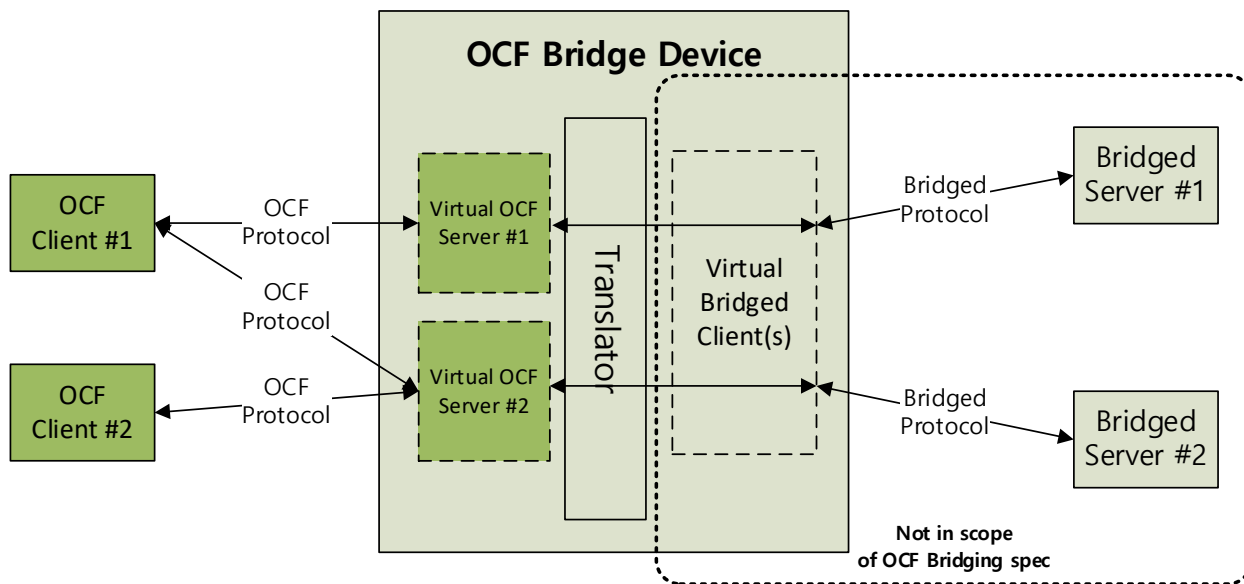

341

342 **Figure 2 – Schematic overview of an OCF Bridge Device bridging non-OCF devices**

343 It is expected that the OCF Bridge Device creates a set of devices during the start-up of the OCF  
 344 Bridge Device. The exposed set of Virtual OCF Devices can change as Bridged Devices are added  
 345 or removed from the bridge. The adding and removing of Bridged Devices is implementation  
 346 dependent. When an OCF Bridge Device changes the set of exposed Virtual OCF Devices, it shall  
 347 notify any OCF Clients subscribed to its "/oic/res".

348 **5.2 Symmetric vs. asymmetric bridging**

349 There are two kinds of bridging: Symmetric, Asymmetric. In symmetric bridging, a bridge device  
 350 exposes OCF server(s) to another ecosystem and exposes other ecosystem's server(s) to OCF. In  
 351 asymmetric bridging, a bridge device exposes OCF server(s) to another ecosystem or exposes  
 352 another ecosystem's server(s) to OCF, but not both. The former case is called an Asymmetric  
 353 Server Bridge (see Figure 3), the latter case is called an Asymmetric Client Bridge (see Figure 4)

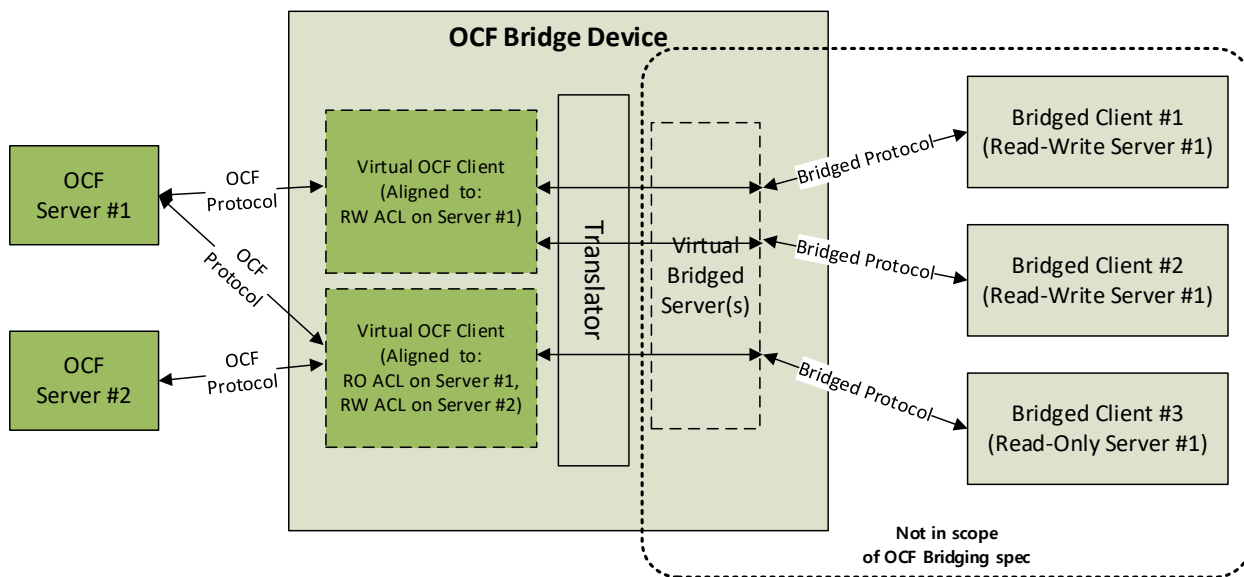

354

355

**Figure 3 – Asymmetric server bridge**

356 In Figure 3 each Bridged Server is exposed as a Virtual OCF Server to OCF side. These Virtual  
 357 OCF Servers are same as normal OCF Servers except that they have additional rt value  
 358 (“oic.d.virtual”) for “/oic/d”. The details of the Virtual Bridged Client are not in scope of this  
 359 document.

360

361

362

**Figure 4 – Asymmetric client bridge**

363 Figure 4 shows that each access to the OCF Server is modelled as a Virtual OCF Client. Those  
 364 accesses can be aggregated if their target OCF servers and access permissions are same,  
 365 therefore a Virtual OCF Client can tackle multiple Bridged Clients.

### 366 **5.3 General requirements**

367 The translator shall check the protocol-independent UUID (“piid” in OCF) of each device and shall  
368 not advertise back into a Bridged Protocol a device originally seen via that Bridged Protocol. The  
369 translator shall stop translating any Bridged Protocol device exposed in OCF via another translator  
370 if the translator sees the device via the Bridged Protocol. Similarly, the translator shall not  
371 advertise an OCF Device back into OCF, and the translator shall stop translating any OCF device  
372 exposed in the Bridged Protocol via another translator if the translator sees the device via OCF.  
373 These require that the translator can determine when a device is already being translated. A Virtual  
374 OCF Device shall be indicated on the OCF Security Domain with a Device Type of “oic.d.virtual”.  
375 This allows translators to determine if a device is already being translated when multiple translators  
376 are present. How a translator determines if a device is already being translated on a non-OCF  
377 Security Domain is described in the protocol-specific clauses (e.g. clause 6).

378 The translator shall detect duplicate virtual devices (with the same protocol-independent UUID)  
379 present in a network and shall not create more than one corresponding virtual device as it translates  
380 those duplicate devices into another network.

381 Each Bridged Server shall be exposed as a separate Virtual OCF Server, with its own OCF Endpoint,  
382 and its own “/oic/d” and “/oic/p”. The Virtual OCF Server’s “/oic/res” resource would be the same  
383 as for any ordinary OCF Server that uses a resource directory. That is, it does not respond to  
384 multicast discovery requests (because the OCF Bridge Device responds on its behalf), but a unicast  
385 query elicits a response listing its own resources with a “rel=hosts” relationship, and an appropriate  
386 “anchor” to indicate that it is not the OCF Bridge Device itself. This allows platform-specific, device-  
387 specific, and resource-specific fields to all be preserved across translation.

388 The introspection data provided by the translator shall include information about all the virtual  
389 devices (and their resources) exposed by the translator at that point in time. This means that the  
390 introspection data provided by the translator before and after a new virtual device is exposed would  
391 be different.

### 392 **5.4 Resource discovery**

393 An OCF Bridge Device shall detect devices that arrive and leave the Bridged network or the OCF  
394 Security Domain. Where there is no pre-existing mechanism to reliably detect the arrival and  
395 departure of devices on a network, an OCF Bridge Device shall periodically poll the network to  
396 detect arrival and departure of devices, for example using COAP multicast discovery (a multicast  
397 RETRIEVE of “/oic/res”) in the case of the OCF Security Domain. OCF Bridge Device  
398 implementations are encouraged to use a poll interval of 30 seconds plus or minus a random delay  
399 of a few seconds.

400 An OCF Bridge Device shall respond to network discovery commands on behalf of the exposed  
401 bridged devices. All bridged devices with all their Resources shall be listed in “/oic/res” of the  
402 Bridge. The response to a RETRIEVE on “/oic/res” shall only include the devices that match the  
403 RETRIEVE request.

404 The resource reference determined from each Link exposed by “/oic/res” on the Bridge shall be  
405 unique. The Bridge shall meet the requirements defined in ISO/IEC 30118-1:2018 for population of  
406 the Properties and Link parameters in “/oic/res”.

407 For example, if an OCF Bridge Device exposes Virtual OCF Servers for the fan and lights shown  
408 in Figure 2, the bridge might return the example payload in Figure 5 to a Client doing a RETRIEVE  
409 on “/oic/res”. (Note that what is returned is not in the JSON format but in a suitable encoding as  
410 defined in ISO/IEC 30118-1:2018)

411 Figure 5 illustrates that each Virtual OCF Server has its own “di” and OCF Endpoint exposed by  
412 the bridge, and that “/oic/p” and “/oic/d” are available for each Virtual OCF Server.

701 **Figure 5 – /oic/res example response**

## 702 5.5 “Deep translation” vs. “on-the-fly”

703 When translating a service between a Bridged Protocol (e.g., AllJoyn) and OCF protocols, there  
704 are two possible types of translation. Translators are expected to dedicate most of their logic to  
705 “deep translation” types of communication, in which data models used with the Bridged Protocol  
706 are mapped to the equivalent OCF Resource Types and vice-versa, in such a way that a compliant  
707 OCF Client or Bridged Client would be able to interact with the service without realising that a  
708 translation was made.

709 “Deep translation” is out of the scope of this document, as the procedure far exceeds mapping of  
710 types. For example, clients on one side of a translator may decide to represent an intensity as an  
711 8-bit value between 0 and 255, whereas the devices on the other may have chosen to represent  
712 that as a floating-point number between 0.0 and 1.0. It’s also possible that the procedure may  
713 require storing state in the translator. Either way, the programming of such translation will require  
714 dedicated effort and study of the mechanisms on both sides.

715 The other type of translation, the “on-the-fly” or “one-to-one” translation, requires no prior  
716 knowledge of the device-specific schema in question on the part of the translator. The burden is,

717 instead, on one of the other participants in the communication, usually the client application. That  
718 stems from the fact that “on-the-fly” translation always produces Bridged Resource Types and OCF  
719 Resource Types as vendor extensions.

720 For AllJoyn, deep translation is specified in ISO/IEC 30118-6:2018, and on-the-fly translation is  
721 covered in clause 7.2 of this document.

## 722 **5.6 Use of introspection**

723 Whenever possible, the translation code should make use of metadata available that indicates what  
724 the sender and recipient of the message in question are expecting. For example, devices that are  
725 AllJoyn Certified are required to carry the introspection data for each object and interface they  
726 expose. When the metadata is available, translators should convert the incoming payload to exactly  
727 the format expected by the recipient and should use information when translating replies to form a  
728 more useful message.

729 For example, for an AllJoyn translator, the expected interaction list is presented in Table 1.

730 **Table 1 – AllJoyn Translator Interaction List**

Message Type	Sender	Receiver	Metadata
Request	AllJoyn 16.10	OCF 1.0	Available
Request	OCF 1.0	AllJoyn 16.10	Available
Response	AllJoyn 16.10	OCF 1.0	Available
Response	OCF 1.0	AllJoyn 16.10	Available

## 731 **5.7 Stability and loss of data**

732 Round-tripping through the translation process specified in this document is not expected to  
733 reproduce the same original message. The process is, however, designed not to lose data or  
734 precision in messages, though it should be noted that both OCF and AllJoyn payload formats allow  
735 for future extensions not considered in this document.

736 However, a third round of translation should produce the same identical message as was previously  
737 produced, provided the same information is available. That is, in the chain shown in Figure 6,  
738 payloads 2 and 4 as well as 3 and 5 should be identical.

739

740 **Figure 6 – Payload Chain.**

## 741 **5.8 Security**

### 742 **5.8.1 General Security Requirements**

743 The OCF Bridge Device shall go through OCF ownership transfer as any other onboarder would.  
744 Separately, it shall go through the Bridged Protocol’s ownership transfer mechanism (e.g., AllJoyn  
745 claiming) normally as any other onboarder would.

746 The OCF Bridge Device shall be field updatable.

747 Unless an administrator opts in to allow it (see 8.2), a translator shall not expose connectivity to  
748 devices to which it cannot get a secure connection.

749 Each Virtual OCF Device shall be provisioned for security by an OCF Onboarding tool. Each Virtual  
750 Bridged Device should be provisioned as appropriate in the Bridged ecosystem. In other words,  
751 Virtual Devices are treated the same way as physical Devices. They are entities that have to be  
752 provisioned in their network.

753 The Translator shall provide a “piid” value that can be used to correlate a non-OCF Device with its  
754 corresponding Virtual OCF Device, as specified in 5.3. An Onboarding Tool might use this  
755 correlation to improve the Onboarding user experience by eliminating or reducing the need for user  
756 input, by automatically creating security settings for Virtual OCF Devices that are equivalent to the  
757 security settings of their corresponding non-OCF Devices. See ISO/IEC 30118-2:2018 for detailed  
758 information about Onboarding.

759 Each Virtual Device shall implement the security requirements of the ecosystem that it is connected  
760 to. For example, each Virtual OCF Device shall implement the behaviour required by ISO/IEC  
761 30118-1:2018 and ISO/IEC 30118-2:2018. Each Virtual OCF Device shall perform authentication,  
762 access control, and encryption according to the security settings it received from the Onboarding  
763 Tool.

764 Depending on the architecture of the Translator, authentication and access control might take place  
765 just within each ecosystem, but not within the Translator. For example, when an OCF Client sends  
766 a request to a Virtual OCF Server:

- 767 – Authentication and access control might be performed by the Virtual OCF Server when receiving  
768 the request from the OCF Client.
- 769 – The Translator might not perform authentication or access control when the request travels  
770 through the Translator to the corresponding Virtual Bridged Client.
- 771 – Authentication and access control might be performed by the target Bridged Server when it  
772 receives the request from the Virtual Bridged Client, according to the security model of the  
773 Bridged ecosystem.

774 A Translator may receive unencrypted data coming from a Bridged Client through a Virtual Bridged  
775 Device. The translated message shall be encrypted by the corresponding Virtual OCF Client, before  
776 sending it to the target OCF Device, if this OCF Device requires encryption.

777 A Translator may receive unencrypted data coming from an OCF Client through a Virtual OCF  
778 Server. After translation, this data shall be encrypted by the corresponding Virtual Bridged Client,  
779 before sending it to the target Bridged Server, if this Bridged Server requires encryption.

780 A Translator shall protect the data while that data travels between a Virtual Client and a Virtual  
781 Server, through the Translator. For example, if the Translator sends data over a network, the  
782 Translator shall perform appropriate authentication and access control, and shall encrypt the data,  
783 between all peers involved in this communication.

### 784 **5.8.2 Blocking communication of Bridged Devices with the OCF ecosystem**

785 An OCF Onboarding Tool shall be able to block the communication of all OCF Devices with all  
786 Bridged Devices that don't communicate securely with the Bridge, by using the Bridge Device's  
787 “oic.r.securemode” Resource.

788 In addition, an OCF Onboarding Tool can block the communication of a particular Virtual OCF  
789 Client with all OCF Servers, or block the communication of all OCF Clients with a particular Virtual  
790 OCF Server, in the same way as it would for any other OCF Device. See ISO/IEC 30118-2:2018  
791 for information about the soft reset state.

## 792 **6 AllJoyn translation**

### 793 **6.1 Operational scenarios**

794 The overall goals are to:

- 795 1) make Bridged Servers appear to OCF clients as if they were native OCF servers, and
- 796 2) make OCF servers appear to Bridged Clients as if they were native non-OCF servers.

### 797 **6.2 Requirements specific to an AllJoyn translator**

#### 798 **6.2.1 Introduction**

799 The translator shall be an AllJoyn Router Node. (This is a requirement so that users can expect  
800 that a certified OCF Bridge Device will be able to talk to any AllJoyn device, without the user having  
801 to buy some other device.)

802 The requirements in clause 6.2 apply when using algorithmic translation, and by default apply to  
803 deep translation unless the relevant clause for such deep translation specifies otherwise.

#### 804 **6.2.2 Exposing AllJoyn producer devices to OCF clients**

##### 805 **6.2.2.1 Virtual OCF Devices and Resources**

806 As specified in ISO/IEC 30118-2:2018 the value of the “di” property of OCF Devices (including  
807 Virtual OCF Devices) shall be established as part of Onboarding of that Virtual OCF Device.

808 Each AllJoyn object shall be mapped to one or more Virtual OCF Resources. If all AllJoyn  
809 interfaces can be translated to resource types on the same resource, there should be a single  
810 Virtual OCF Resource, and the path component of the URI of the Virtual OCF Resource shall be  
811 the AllJoyn object path, where each “\_h” in the AllJoyn object path is transformed to “-” (hyphen),  
812 each “\_d” in the AllJoyn object path is transformed to “.” (dot), each “\_t” in the AllJoyn object path  
813 is transformed to “~” (tilde), and each “\_u” in the AllJoyn object path is transformed to “\_”  
814 (underscore). Otherwise, a Resource with that path shall exist with a Resource Type of  
815 [“oic.wk.col”, “oic.r.alljoynobject”] which is a Collection of links, where “oic.r.alljoynobject” is  
816 defined in clause 8.2 and the items in the collection are the Resources with the translated Resource  
817 Types.

818 The value of the “piid” property of “/oic/d” for each Virtual OCF Device shall be the value of the  
819 OCF-defined AllJoyn field “org.openconnectivity.piid” in the AllJoyn About Announce signal, if that  
820 field exists, else it shall be calculated by the Translator as follows:

- 821 – If the AllJoyn device supports security, the value of the “piid” property value shall be the peer  
822 GUID.
- 823 – If the AllJoyn device does not support security but the device is being bridged anyway (see 8.2),  
824 the “piid” property value shall be derived from the DeviceId and Appld properties (in the About  
825 data), by concatenating the DeviceId value (not including any null termination) and the Appld  
826 bytes and using the result as the “name” to be used in the algorithm specified in IETF RFC 4122  
827 clause 4.3, with SHA-1 as the hash algorithm, and 8f0e4e90-79e5-11e6-bdf4-0800200c9a66  
828 as the name space ID. (This is to address the problem of being able to de-duplicate AllJoyn  
829 devices exposed via separate OCF Bridge Devices.)

830 A translator implementation is encouraged to listen for AllJoyn About Announce signals matching  
831 any AllJoyn interface name. It can maintain a cache of information it received from these signals,  
832 and use the cache to quickly handle “/oic/res” queries from OCF Clients (without having to wait for  
833 Announce signals while handling the queries).

834 A translator implementation is encouraged to listen for other signals (including  
 835 EmitsChangedSignal of properties) only when there is a client subscribed to a corresponding  
 836 resource on a Virtual AllJoyn Device.

837 There are multiple types of AllJoyn interfaces, which shall be handled as follows.

838 1) If the AllJoyn interface is in a well-defined set (defined in ISO/IEC 30118-6:2018 or 6.2.2.2) of  
 839 interfaces where standard forms exist on both the AllJoyn and OCF sides, the translator shall  
 840 either:

- 841 a) follow the specification for translating that interface specially, or
- 842 b) not translate the AllJoyn interface.

843 2) If the AllJoyn interface is not in the well-defined set, the translator shall either:

- 844 a) not translate the AllJoyn interface, or
- 845 b) algorithmically map the AllJoyn interface as specified in 6.3 to custom/vendor-defined  
 846 Resource Types by converting the AllJoyn interface name to OCF resource type name(s).

847 An AllJoyn interface name shall be converted to a Device Type or a set of one or more OCF  
 848 Resource Types as follows:

- 849 1) If the AllJoyn interface has any members, append a suffix “.<seeBelow>” where <seeBelow> is  
 850 described in this clause.
- 851 2) For each upper-case letter present in the entire string, replace it with a hyphen followed by the  
 852 lower-case version of that letter (e.g., convert “A” to “-a”).
- 853 3) If an underscore appears followed by a (lower-case) letter or a hyphen, for each such  
 854 occurrence, replace the underscore with two hyphens (e.g., convert “\_a” to “--a”, “\_a” to “---  
 855 a”).
- 856 4) For each underscore remaining, replace it with a hyphen (e.g., convert “\_1” to “-1”).
- 857 5) Prepend the “x.” prefix.

858 Some examples are shown in Table 2. The first three are normal AllJoyn names converted to  
 859 unusual OCF names. The last three are unusual AllJoyn names converted (perhaps back) to  
 860 normal OCF names. (“xn--” is a normal domain name prefix for the Punycode-encoded form of an  
 861 Internationalized Domain Name, and hence can appear in a normal vendor-specific OCF name.)

862 **Table 2 – AllJoyn to OCF Name Examples**

From AllJoyn name	To OCF name
example.Widget	x.example.-widget
example.my__widget	x.example.my----widget
example.My_Widget	x.example.-my---widget
xn_p1ai.example	x.xn--p1ai.example
xn__90ae.example	x.xn--90ae.example
example.myName_1	x.example.my-name-1

863 Each AllJoyn interface that has members and is using algorithmic mapping shall be mapped to one  
 864 or more Resource Types as follows:

- 865 – AllJoyn Properties with the same EmitsChangedSignal value are mapped to the same Resource  
 866 Type where the value of the <seeBelow> label is the value of EmitsChangedSignal. AllJoyn  
 867 Properties with EmitsChangedSignal values of “const” or “false”, are mapped to Resources that  
 868 are not Observable, whereas AllJoyn Properties with EmitsChangedSignal values of “true” or

869 “invalidates” result in Resources that are Observable. The Version property in an AllJoyn  
870 interface is always considered to have an EmitsChangedSignal value of “const”, even if not  
871 specified in introspection XML. The name of each property on the Resource Type shall be  
872 “<ResourceType>.<AllJoynPropertyName>”, where each “\_d” in the <AllJoynPropertyName> is  
873 transformed to “.” (dot), and each “\_h” in the <AllJoynPropertyName> is transformed to “-”  
874 (hyphen).

875 – Resource Types mapping AllJoyn Properties with access “readwrite” shall support the “oic.if.rw”  
876 OCF Interface. Resource Types mapping AllJoyn Properties with access “read” shall support  
877 the “oic.if.r” OCF Interface. Resource Types supporting both the “oic.if.rw” and “oic.if.r” OCF  
878 Interfaces shall choose “oic.if.r” as the default Interface.

879 – Each AllJoyn Method is mapped to a separate Resource Type, where the value of the  
880 <seeBelow> label is the AllJoyn Method name. The Resource Type shall support the “oic.if.rw”  
881 OCF Interface. Each argument of the AllJoyn Method shall be mapped to a separate Property  
882 on the Resource Type, where the name of that Property is prefixed with  
883 “<ResourceType>arg<#>”, where <#> is the 0-indexed position of the argument in the AllJoyn  
884 introspection xml, in order to help get uniqueness across all Resource Types on the same  
885 Resource. Therefore, when the AllJoyn argument name is not specified, the name of that  
886 property is “<ResourceType>arg<#>”, where <#> is the 0-indexed position of the argument in  
887 the AllJoyn introspection XML. In addition, that Resource Type has an extra  
888 “<ResourceType>validity” property that indicates whether the rest of the properties have valid  
889 values. When the values are sent as part of an UPDATE response, the validity property is true,  
890 and any other properties have valid values. In a RETRIEVE (GET or equivalent in the relevant  
891 transport binding) response, the validity property is false, and any other properties can have  
892 meaningless values. If the validity property appears in an UPDATE request, its value shall be  
893 true (a value of false shall result in an error response).

894 – Each AllJoyn Signal (whether sessionless, sessioncast, or unicast) is mapped to a separate  
895 Resource Type on an Observable Resource, where the value of the <seeBelow> label is the  
896 AllJoyn Signal name. The Resource Type shall support the “oic.if.r” OCF Interface. Each  
897 argument of the AllJoyn Signal is mapped to a separate Property on the Resource Type, where  
898 the name of that Property is prefixed with “<ResourceType>arg<#>”, where <#> is the 0-indexed  
899 position of the argument in the AllJoyn introspection xml, in order to help get uniqueness across  
900 all Resource Types on the same Resource. Therefore, when the AllJoyn argument name is not  
901 specified, the name of that property is “<ResourceType>arg<#>”, where <#> is the 0-indexed  
902 position of the argument in the AllJoyn introspection XML. In addition, that Resource Type has  
903 an extra “<ResourceType>validity” property that indicates whether the rest of the properties  
904 have valid values. When the values are sent as part of a NOTIFY response, the validity property  
905 is true, and any other properties have valid values. In a RETRIEVE (GET or equivalent in the  
906 relevant transport binding) response, the validity property is false, and any other properties  
907 returned can have meaningless values. This is because in AllJoyn, the signals are  
908 instantaneous events, and the values are not necessarily meaningful beyond the lifetime of that  
909 message. Note that AllJoyn does have a TTL field that allows store-and-forward signals, but  
910 such support is not required in OCF 1.0. We expect that in the future, the TTL may be used to  
911 allow valid values in response to a RETRIEVE that is within the TTL.

912 When an algorithmic mapping is used, AllJoyn data types shall be mapped to OCF property types  
913 according to 6.3.

914 If an AllJoyn operation fails, the translator shall send an appropriate OCF error response to the  
915 OCF client. If an AllJoyn error name is available and does not contain the  
916 “org.openconnectivity.Error.Code” prefix, it shall construct an appropriate OCF error message (e.g.,  
917 diagnostic payload if using CoAP) from the AllJoyn error name and AllJoyn error message (if any),  
918 using the form “<error name>: <error message>”, with the <error name> taken from the AllJoyn  
919 error name field and the <error message> taken from the AllJoyn error message, and the CoAP  
920 error code set to an appropriate value (if CoAP is used). If an AllJoyn error name is available and

921 contains the "org.openconnectivity.Error.Code" prefix, the OCF error message (e.g., diagnostic  
 922 payload if using CoAP) should be taken from the AllJoyn error message (if any), and the CoAP  
 923 error code (if CoAP is used) set to a value derived as follows; remove the  
 924 "org.openconnectivity.Error.Code" prefix, and if the resulting error name is of the form "<#>" where  
 925 <#> is an error code without a decimal (e.g., "404"), the CoAP error code shall be the error code  
 926 indicated by the "<#>". Example: "org.openconnectivity.Error.Code404" becomes "404", which  
 927 shall result in an error 4.04 for a CoAP transport.

928 **6.2.2.2 Exposing an AllJoyn producer application as a Virtual OCF Server**

929 Table 3 shows how OCF Device properties, as specified in Table 27 in ISO/IEC 30118-1:2018 shall  
 930 be derived, typically from fields specified in the AllJoyn About Interface Specification and AllJoyn  
 931 Configuration Interface Specification.

932 If the AllJoyn About or Config data field has a mapping rule defined (as in Table 3, Table 4, Table 5,  
 933 and Table 6), the field name shall be translated based on that mapping rule; else if the AllJoyn  
 934 About or Config data field has a fully qualified name (with a <domain> prefix (such as  
 935 "com.example", "org.alljoyn"), the field name shall be translated based on the rules specified in  
 936 6.2.2 for mapping AllJoyn fields; else, the field shall not be translated as it may be incorrect (error)  
 937 or it has no valid mapping (such as daemonRealm and passCode).

938 **Table 3 – oic.wk.d resource type definition**

To OCF Property title	OCF Property name	OCF Description	OCF Mand ?	From AJ Field name	AJ Description	AJ Mand?
(Device) Name	n	Human friendly name For example, "Bob's Thermostat"	Y	AppName (no exact equivalent exists)	Application name assigned by the app manufacturer (developer or the OEM).	Y
Spec Version	icv	Spec version of the core specification this device is implemented to, the syntax is "core.major.minor"]	Y	(none)	Translator should return its own value	
Device ID	di	Unique identifier for Device. This value shall be as defined in ISO/IEC 30118-2:2018 for DeviceID.	Y	(none)	Use as defined in ISO/IEC 30118-2:2018	
Protocol-Independent ID	piid	Unique identifier for OCF Device (UUID)	Y	org.openconnectivity.piid if it exists, else "Peer GUID" (not in About, but exposed by protocol) if authenticated, else Hash(DeviceId,Appld) where the Hash is done by concatenating the Device Id (not including any null terminator) and the Appld and using the algorithm in IETF RFC 4122	Peer GUID: The peer GUID is the only persistent identity for a peer. Peer GUIDs are used by the authentication mechanisms to uniquely identify a remote application instance. The peer GUID for a remote peer is only available if the remote peer has	Peer GUID: conditionally Y  DeviceId: Y  Appld: Y

				<p>clause 4.3, with SHA-1.</p> <p>This means that the value of di may change if the resource is read both before and after authentication, in order to mitigate privacy concerns discussed in RFC 6973.</p>	<p>been authenticated.</p> <p>DeviceId: Device identifier set by platform-specific means.</p> <p>AppId: A 128-bit globally unique identifier for the application. The AppId shall be a universally unique identifier as specified in IETF RFC 4122.</p>	
Data Model Version	dmv	<p>Spec version(s) of the vertical specifications this device data model is implemented to. The syntax is a comma separated list of "&lt;vertical&gt;.major.minor". &lt;vertical&gt; is the name of the vertical (i.e. sh for Smart Home)</p>	Y	<p>Comma separated list of the Version property values of each interface listed in the objectDescription argument of the Announce signal of About. In addition to the mandatory values specified in ISO/IEC 30118-1:2018, additional values are formatted as "x.&lt;interface name&gt;.&lt;Version property value&gt;".</p>	<p>This document assumes that the value of the Version property is the same as the value of the "org.gtk.GDBus.Since" annotation of the interface in the AllJoyn introspection XML, and therefore the value of the Version property may be determined through introspection alone.</p> <p>Note that AllJoyn specifies that the default value is 1 if the "org.gtk.GDBus.Since" annotation is absent.</p>	<p>N, but required by IRB for all standard interfaces, and absence can be used to imply a constant (e.g., 0)</p>
Localized Descriptions	ld	<p>Detailed description of the Device, in one or more languages. This property is an array of objects where each object has a 'language' field (containing an RFC 5646 language tag) and a 'value' field containing the device description in the indicated language.</p>	N	Description	<p>Detailed description expressed in language tags as in RFC 5646.</p>	Y
Software Version	sv	<p>Version of the device software.</p>	N	SoftwareVersion	<p>Software version of the app.</p>	Y
Manufacturer Name	dmn	<p>Name of manufacturer of the Device, in one or more languages. This property is an array of objects</p>	N	Manufacturer	<p>The manufacturer's name of the app.</p>	Y

		where each object has a 'language' field (containing an RFC 5646 language tag) and a 'value' field containing the manufacturer name in the indicated language.				
Model Number	dmno	Model number as designated by manufacturer.	N	ModelNumber	The app model number.	Y

939

940 In addition, any additional vendor-defined fields in the AllJoyn About data shall be mapped to  
 941 vendor-defined properties in the OCF Device resource “/oic/d” (which implements the “oic.wk.d”  
 942 resource type), with a property name formed by prepending “x.” to the AllJoyn field name.

943 Table 4 shows how OCF Device Configuration properties, as specified in Table 22 in ISO/IEC  
 944 30118-1:2018 shall be derived:

945

**Table 4 – oic.wk.con resource type definition**

To OCF Property title	OCF Property name	OCF Description	OCF Mand?	From AJ Field name	AJ Description	AJ Mand?
(Device) Name	n	Human friendly name For example, “Bob’s Thermostat”	Y	AppName (no exact equivalent exists)	Application name assigned by the app manufacturer (developer or the OEM).	Y
Location	loc	Provides location information where available.	N	org.openconnectivity.loc (if it exists, else property shall be absent)		N
Location Name	locn	Human friendly name for location For example, “Living Room”.	N	org.openconnectivity.locn (if it exists, else property shall be absent)		N
Currency	c	Indicates the currency that is used for any monetary transactions	N	org.openconnectivity.c (if it exists, else property shall be absent)		N
Region	r	Free form text Indicating the current region in which the device is located geographically. The free form text shall not start with a quote (“).	N	org.openconnectivity.r (if it exists, else property shall be absent)		N
Localized Names	ln	Human-friendly name of the Device, in one or more languages. This property is an array of objects where	N	AppName	Application name assigned by the app manufacturer (developer or the OEM).	Y

		each object has a 'language' field (containing an RFC 5646 language tag) and a 'value' field containing the device name in the indicated language. If this property and the Device Name (n) property are both supported, the Device Name (n) value shall be included in this array.				
Default Language	dl	The default language supported by the Device, specified as an RFC 5646 language tag. By default, clients can treat any string property as being in this language unless the property specifies otherwise.	N	DefaultLanguage	The default language supported by the device. Specified as an IETF language tag listed in RFC 5646.	Y

946

947 In addition, any additional vendor-defined fields in the AllJoyn Configuration data shall be mapped  
 948 to vendor-defined properties in the OCF Configuration resource (which implements the "oic.wk.con"  
 949 resource type and optionally the "oic.wk.con.p" resource type), with a property name formed by  
 950 prepending "x." to the AllJoyn field name.

951 Table 5 shows how OCF Platform properties, as specified in Table 28 in ISO/IEC 30118-1:2018  
 952 shall be derived, typically from fields specified in the AllJoyn About Interface Specification and  
 953 AllJoyn Configuration Interface Specification.

954

**Table 5 – oic.wk.p resource type definition**

To OCF Property title	OCF Property name	OCF Description	OCF Mand?	From AJ Field name	AJ Description	AJ Mand?
Platform ID	pi	Unique identifier for the physical platform (UIUID); this shall be a UUID in accordance with IETF RFC 4122. It is recommended that the UUID be created using the random generation	Y	DeviceId if it is a UUID, else generate a name-based UUID from the DeviceId using the DeviceId value (not including any null termination) as the "name" to be used in the algorithm specified in IETF RFC 4122 clause 4.3, with SHA-1 as the hash algorithm, and 8f0e4e90-79e5-11e6-bdf4-0800200c9a66 as the name space ID.	Name of the device set by platform-specific means (such as Linux and Android).	Y

		scheme (version 4 UUID) specific in the RFC.				
Manufacturer Name	mnmn	Name of manufacturer (not to exceed 16 characters)	Y	Manufacturer (in DefaultLanguage, truncated to 16 characters)	The manufacturer's name of the app.	Y
Manufacturer Details Link (URL)	mnml	URL to manufacturer (not to exceed 32 characters)	N	org.openconnectivity.mnml (if it exists, else property shall be absent)		N
Model Number	mnmo	Model number as designated by manufacturer	N	ModelNumber	The app model number.	Y
Date of Manufacture	mndt	Manufacturing date of device	N	DateOfManufacture	Date of manufacture using format YYYY-MM-DD (known as XML DateTime format).	N
Platform Version	mnpv	Version of platform – string (defined by manufacturer)	N	org.openconnectivity.mnpv (if it exists, else property shall be absent)		N
OS Version	mnos	Version of platform resident OS – string (defined by manufacturer)	N	org.openconnectivity.mnos (if it exists, else property shall be absent)		N
Hardware Version	mnhw	Version of platform hardware	N	HardwareVersion	Hardware version of the device on which the app is running.	N
Firmware version	mnfv	Version of device firmware	N	org.openconnectivity.mnfv (if it exists, else property shall be absent)		N
Support URL	mnsi	URL that points to support information from manufacturer	N	SupportUrl	Support URL (populated by the manufacturer)	N
SystemTime	st	Reference time for the device	N	org.openconnectivity.st (if it exists, else property shall be absent)		N
Vendor ID	vid	Vendor defined string for the platform. The string is freeform and up to the vendor on what text to populate it.	N	DeviceId	Name of the device set by platform-specific means (such as Linux and Android).	Y

--	--	--	--	--	--	--

955 Table 6 shows how OCF Platform Configuration properties, as specified in Table 23 in the ISO/IEC  
 956 30118-1:2018 shall be derived:

957 **Table 6 – oic.wk.con.p resource type definition**

To OCF Property title	OCF Property name	OCF Description	OCF Mand?	From AJ Field name	AJ Description	AJ Mand?
Platform Names	Mnppn	Platform Identifier	N	DeviceName	Name of the device set by platform-specific means (such as Linux and Android).	Device name assigned by the user. The device name appears on the UI as the friendly name of the device.

958

959 In addition, the “oic.wk.mnt” properties Factory\_Reset (“fr”) and Reboot (“rb”) shall be mapped to  
 960 AllJoyn Configuration methods FactoryReset and Restart, respectively.

961 **6.2.3 Exposing OCF resources to AllJoyn consumer applications**

962 **6.2.3.1 Use of AllJoyn Producer Application**

963 Unless specified otherwise, each OCF resource shall be mapped to a separate AllJoyn object.

964 Each OCF Server shall be exposed as a separate AllJoyn producer application, with its own About  
 965 data. This allows platform-specific, device-specific, and resource-specific fields to all be preserved  
 966 across translation. However, this requires that AllJoyn Claiming of such producer applications be  
 967 solved in a way that does not require user interaction, but this is left as an implementation issue.

968 The AllJoyn producer application shall implement the “oic.d.virtual” AllJoyn interface. This allows  
 969 translators to determine if a device is already being translated when multiple translators are present.  
 970 The “oic.d.virtual” interface is defined as follows:

```
971 <interface name="oic.d.virtual"/>
```

972 The implementation may choose to implement this interface by the AllJoyn object at path “/oic/d”.

973 The AllJoyn peer ID shall be the OCF device ID (“di”).

974 Unless specified otherwise, the AllJoyn object path shall be the OCF URI path, where each “-”  
 975 (hyphen) in the OCF URI path is transformed to “\_h”, each “.” (dot) in the OCF URI path is  
 976 transformed to “\_d”, each “~” (tilde) in the OCF URI path is transformed to “\_t”, and each “\_”  
 977 (underscore) in the OCF URI path is transformed to “\_u”.

978 The AllJoyn About data shall be populated per Table 8.

979 A translator implementation is encouraged to maintain a cache of OCF resources to handle the  
 980 implementation of queries from the AllJoyn side, and emit an Announce Signal for each OCF Server.  
 981 Specifically, the translator could always Observe “/oic/res” changes and only Observe other  
 982 resources when there is a client with a session on a Virtual AllJoyn Device.

983 There are multiple types of resources, which shall be handled as follows.

984 1) If the Resource Type is in a well-defined set (defined in ISO/IEC 30118-6:2018 or 6.2.3.2) of  
 985 resource types where standard forms exist on both the AllJoyn and OCF sides, the translator  
 986 shall either:

- 987 a) follow the specification for translating that resource type specially, or
- 988 b) not translate the Resource Type.

989 2) If the Resource Type is not in the well-defined set (but is not a Device Type), the translator  
 990 shall either:

- 991 a) not translate the Resource Type, or
- 992 b) algorithmically map the Resource Type as specified in 6.3 to a custom/vendor-defined  
 993 AllJoyn interface by converting the OCF Resource Type name to an AllJoyn Interface name.

994 An OCF Resource Type or Device Type shall be converted to an AllJoyn interface name as follows:

- 995 1) Remove the “x.” prefix if present
- 996 2) For each occurrence of a hyphen (in order from left to right in the string):
  - 997 a) If the hyphen is followed by a letter, replace both characters with a single upper-case version  
 998 of that letter (e.g., convert “-a” to “A”).
  - 999 b) Else, if the hyphen is followed by another hyphen followed by either a letter or a hyphen,  
 1000 replace two hyphens with a single underscore (e.g., convert “--a” to “\_a”, “--” to “\_”).
  - 1001 c) Else, convert the hyphen to an underscore (i.e., convert “-” to “\_”).

1002 Some examples are shown in the Table 7. The first three are unusual OCF names converted  
 1003 (perhaps back) to normal AllJoyn names. The last three are normal OCF names converted to  
 1004 unusual AllJoyn names. (“xn--” is a normal domain name prefix for the Punycode-encoded form of  
 1005 an Internationalized Domain Name, and hence can appear in a normal vendor-specific OCF name.)

1006 **Table 7 – Example name mapping**

From OCF name	To AllJoyn name
x.example.-widget	example.Widget
x.example.my----widget	example.my__widget
x.example.-my---widget	example.My_Widget
x.xn--p1ai.example	xn_p1ai.example
x.xn--90ae.example	xn__90ae.example
x.example.my-name-1	example.myName_1

1007 An OCF Device Type is mapped to an AllJoyn interface with no members.

1008 Unless specified otherwise, each OCF Resource Type shall be mapped to an AllJoyn interface as  
 1009 follows:

- 1010 – Each OCF property is mapped to an AllJoyn property in that interface, where each “.” (dot) in  
 1011 the OCF property is transformed to “\_d”, and each “-” (hyphen) in the OCF property is  
 1012 transformed to “\_h”.
- 1013 – The EmitsChangedSignal value for each AllJoyn property shall be set to “true” if the resource  
 1014 supports NOTIFY, or “false” if it does not. (The value is never set to “const” or “invalidates”  
 1015 since those concepts cannot currently be expressed in OCF.)
- 1016 – The “access” attribute for each AllJoyn property shall be “read” if the OCF property is read-only,  
 1017 or “readwrite” if the OCF property is read-write.

- 1018 – If the resource supports DELETE, a Delete() method shall appear in the interface.
  - 1019 – If the resource supports CREATE, a Create() method shall appear in the interface, with input
  - 1020 arguments of each property of the resource to create. (Such information is not available
  - 1021 algorithmically can be determined via introspection.) If such information is not available, a
  - 1022 CreateWithDefaultValues() method shall appear which takes no input arguments. In either
  - 1023 case, the output argument shall be an OBJECT\_PATH containing the path of the created
  - 1024 resource.
  - 1025 – If the resource supports UPDATE (i.e., the “oic.if.rw” or “oic.if.a” OCF Interface) then an AllJoyn
  - 1026 property set operation (i.e., an org.freedesktop.DBus.Properties.Set() method call) shall be
  - 1027 mapped to a Partial UPDATE (e.g., POST in CoAP) with the corresponding OCF property.
  - 1028 – If a Resource has a Resource Type “oic.r.alljoynobject”, then instead of separately translating
  - 1029 each of the Resources in the collection to its own AllJoyn object, all Resources in the collection
  - 1030 shall instead be translated to a single AllJoyn object whose object path is the OCF URI path of
  - 1031 the collection.
- 1032 OCF property types shall be mapped to AllJoyn data types according to 6.3.

1033 If an OCF operation fails, the translator shall send an appropriate AllJoyn error response to the

1034 AllJoyn consumer. If an error message is present in the OCF response, and the error message

1035 (e.g., diagnostic payload if using CoAP) fits the pattern "<error name>: <error message>" where

1036 <error name> conforms to the AllJoyn error name syntax requirements, the AllJoyn error name and

1037 AllJoyn error message shall be extracted from the error message in the OCF response. Otherwise,

1038 the AllJoyn error name shall be "org.openconnectivity.Error.Code<#>" where <#> is the error code

1039 (e.g., CoAP error code) in the OCF response without a decimal (e.g., "404") and the AllJoyn error

1040 message is the error message in the OCF response.

### 1041 6.2.3.2 Exposing an OCF server as a Virtual AllJoyn Producer

1042 The object description returned in the About interface shall be formed as specified in the AllJoyn

1043 About Interface Specification, and Table 8 shows how AllJoyn About Interface fields shall be

1044 derived, based on properties in “oic.wk.d”, “oic.wk.con”, “oic.wk.p”, and “oic.wk.con.p”.

1045 **Table 8 – AllJoyn about data fields**

To AJ Field name	AJ Description	AJ Mand?	From OCF Property title	OCF Property name	OCF Description	OCF Mand?
Appld	A 128-bit globally unique identifier for the application. The Appld shall be a universally unique identifier as specified in RFC 4122.	Y	Device ID (no exact equivalent exists)	di	Unique identifier for OCF Device (UUID)	Y
DefaultLanguage	The default language supported by the device. Specified as an IETF language tag listed in RFC 5646.	Y	Default Language	dl	The default language supported by the Device, specified as an RFC 5646 language tag. By default, clients can treat any string property as being in this language unless the property specifies otherwise.	N

					If absent, the translator shall return a constant, e.g., empty string	
DeviceName (per supported language)	Name of the device set by platform-specific means (such as Linux and Android).	N	Platform Names	mnpn	Friendly name of the Platform. This property is an array of objects where each object has a 'language' field (containing an RFC 5646 language tag) and a 'value' field containing the platform friendly name in the indicated language.  For example, [{"language": "en", "value": "Dave's Laptop"}]	N
DeviceId	Device identifier set by platform-specific means.	Y	Platform ID	pi	Platform Identifier	Y
AppName (per supported language)	Application name assigned by the app manufacturer (developer or the OEM).	Y	Localized Names, if it exists, else (Device) Name	In or n	Human-friendly name of the Device, in one or more languages. This property is an array of objects where each object has a 'language' field (containing an RFC 5646 language tag) and a 'value' field containing the device name in the indicated language. If this property and the Device Name (n) property are both supported, the Device Name (n) value shall be included in this array.	N (In), Y (n)
Manufacturer (per supported language)	The manufacturer's name of the app.	Y	Manufacturer Name	dmn	Name of manufacturer of the Device, in one or more languages. This property is an array of objects where each object has a 'language' field (containing an RFC 5646 language tag) and a 'value' field containing the manufacturer name in the indicated language.	N

ModelNumber	The app model number.	Y	Model Number	dmno	Model number as designated by manufacturer	N
SupportedLanguages	List of supported languages.	Y	language fields of Localized Names	In	If In is supported, return the list of values of the language field of each array element, else return empty array	N
Description (per supported language)	Detailed description expressed in language tags as in RFC 5646.	Y	Localized Descriptions	Id	Detailed description of the Device, in one or more languages. This property is an array of objects where each object has a 'language' field (containing an RFC 5646 language tag) and a 'value' field containing the device description in the indicated language.	N
DateOfManufacture	Date of manufacture using format YYYY-MM-DD (known as XML DateTime format).	N	Date of Manufacture	mndt	Manufacturing date of device	N
SoftwareVersion	Software version of the app.	Y	Software Version	sv	Software version of the device.	N
AJSoftwareVersion	Current version of the AllJoyn SDK used by the application.	Y	(none)		Translator should return its own value	
HardwareVersion	Hardware version of the device on which the app is running.	N	Hardware Version	mnhw	Version of platform hardware	N
SupportUrl	Support URL (populated by the manufacturer).	N	Support URL	mnsI	URL that points to support information from manufacturer	N
org.openconnectivity.mnml		N	Manufacturer Details Link (URL)	mnml (if it exists, else field shall be absent)	URL to manufacturer (not to exceed 32 characters)	N
org.openconnectivity.mnpv		N	Platform Version	mnpv (if it exists, else field shall be absent)	Version of platform – string (defined by manufacturer)	N
org.openconnectivity.mnos		N	OS Version	mnos (if it exists, else field	Version of platform resident OS – string	N

				shall be absent)	(defined by manufacturer)	
org.openconnectivity.mnfv		N	Firmware version	mnfv (if it exists, else field shall be absent)	Version of device firmware	N
org.openconnectivity.st		N	SystemTime	st (if it exists, else field shall be absent)	Reference time for the device	N
org.openconnectivity.piid		N	Protocol-Independent ID	piid	A unique and immutable Device identifier. A Client can detect that a single Device supports multiple communication protocols if it discovers that the Device uses a single Protocol Independent ID value for all the protocols it supports.	Y

1046

1047 The AllJoyn field “org.openconnectivity.piid” shall be announced but shall not be localized and its  
1048 D-Bus type signature shall be “s”. All other AllJoyn field names listed in Table 5 which have the  
1049 prefix “org.openconnectivity.” shall be neither announced nor localized and their D-Bus type  
1050 signature shall be “s”.

1051 In addition, any additional vendor-defined properties in the OCF Device resource “/oic/d” (which  
1052 implements the “oic.wk.d” resource type) and the OCF Platform resource “/oic/p” (which implements  
1053 the “oic.wk.p” resource type) shall be mapped to vendor-defined fields in the AllJoyn About data,  
1054 with a field name formed by removing the leading “x.” from the property name.

1055 Table 9 shows how AllJoyn Configuration Interface fields shall be derived, based on properties in  
1056 “oic.wk.con” and “oic.wk.con.p”.

1057

**Table 9 – AllJoyn configuration data fields**

To AJ Field name	AJ Description	AJ Mand?	From OCF Property title	OCF Property name	OCF Description	OCF Mand?
DefaultLanguage	Default language supported by the device.	N	Default Language	dl	The default language supported by the Device, specified as an RFC 5646 language tag. By default, clients can treat any string property as being in this language unless the property specifies otherwise.	N
DeviceName	Device name assigned by	N	PlatformNames	mnpn	Friendly name of the Platform. This	N

	the user. The device name appears on the UI as the friendly name of the device.				property is an array of objects where each object has a 'language' field (containing an RFC 5646 language tag) and a 'value' field containing the platform friendly name in the indicated language.  For example, [{"language": "en", "value": "Dave's Laptop"}]	
org.openconnectivity.loc		N	Location	loc (if it exists, else field shall be absent)	Provides location information where available.	N
org.openconnectivity.locn		N	Location Name	locn (if it exists, else field shall be absent)	Human friendly name for location For example, "Living Room".	N
org.openconnectivity.c		N	Currency	c (if it exists, else field shall be absent)	Indicates the currency that is used for any monetary transactions	N
org.openconnectivity.r		N	Region	r (if it exists, else field shall be absent)	Free form text Indicating the current region in which the device is located geographically. The free form text shall not start with a quote (").	N

1058

1059 The AllJoyn field "org.openconnectivity.loc" shall be neither announced nor localized and its D-Bus  
1060 type signature shall be "ad". All other AllJoyn field names listed in Table 5 which have the prefix  
1061 "org.openconnectivity." shall be neither announced nor localized and their D-Bus type signature  
1062 shall be "s".

1063 In addition, the Configuration methods FactoryReset and Restart shall be mapped to "oic.wk.mnt"  
1064 properties Factory\_Reset ("fr") and Reboot ("rb"), respectively, and any additional vendor-defined  
1065 properties in the OCF Configuration resource (which implements the "oic.wk.con" resource type  
1066 and optionally the "oic.wk.con.p" resource type) shall be mapped to vendor-defined fields the  
1067 AllJoyn Configuration data, with a field name formed by removing the leading "x." from the property  
1068 name.

### 1069 6.3 On-the-Fly Translation from D-Bus and OCF payloads

#### 1070 6.3.1 Introduction

1071 The "dbus1" payload format is specified in the D-Bus Specification and AllJoyn adopted the D-Bus  
1072 protocol and made it distributed over the network. The modifications done by AllJoyn to the format

1073 are all in the header part of the packet, not in the data payload itself, which remains compatible  
 1074 with “dbus1”. Other variants of the protocol that have been proposed by the Linux community  
 1075 (“GVariant” and “kdbus” payloads) contain slight incompatibilities and are not relevant for this  
 1076 discussion.

1077 **6.3.2 Translation without aid of introspection**

1078 **6.3.2.1 Introduction**

1079 Clause 6.3.2 describes how translators shall translate messages between the two payload formats  
 1080 in the absence of introspection metadata from the actual device. This situation arises in the when  
 1081 there is content not described by introspection, such as the inner payload of AllJoyn properties of  
 1082 type “D-Bus VARIANT”.

1083 Since introspection is not available, the translator cannot know the rich JSON sub-type, only the  
 1084 underlying CBOR type and from that it can infer the JSON generic type, and hence translation is  
 1085 specified in terms of those generic types.

1086 **6.3.2.2 Booleans**

1087 Boolean conversion is trivial since both sides support this type.

1088 **Table 10 – Boolean translation**

D-Bus type	JSON type
“b” – BOOLEAN	boolean (true or false)

1089

1090 **6.3.2.3 Numeric types**

1091 The translation of numeric types is lossy and that is unavoidable due to the limited expressiveness  
 1092 of the JSON generic types. This can only be solved with introspection.

1093 The translation of numeric types is direction-specific.

1094 **Table 11 – Numeric type translation, D-Bus to JSON**

From D-Bus type	To JSON type
“y” - BYTE (unsigned 8-bit)	Number
“n” - UINT16 (unsigned 16-bit)	
“u” - UINT32 (unsigned 32-bit)	
“t” - UINT64 (unsigned 64-bit) <sup>a</sup>	
“q” - INT16 (signed 16-bit)	
“” - INT32 (signed 32-bit)	
“x” - INT64 (signed 64-bit) <sup>a</sup>	
“d” - DOUBLE (IEEE 754 double precision)	

<sup>a</sup> D-Bus payloads of types “t” (UINT64) and “x” (INT64) can contain values that cannot be perfectly represented in IEEE 754 double-precision floating point. The RFCs governing JSON do not forbid such numbers but caution that many implementations may not be able to deal with them. Currently, OCF transports its payload using CBOR instead of JSON, which can represent those numbers with fidelity. However, it should be noted that ISO/IEC 30118-1:2018 does not allow for integral numbers outside the range  $-2^{53} \leq x \leq 2^{53}$ .

1095

1096

**Table 12 – Numeric type translation, JSON to D-Bus**

From JSON type	To D-Bus type
number	"d" - DOUBLE <sup>a</sup>
<sup>a</sup> To provide the most predictable result, all translations from OCF to AllJoyn produce values of type "d" DOUBLE (IEEE 754 double precision).	

1097

1098

1099 **6.3.2.4 Text strings**

1100

**Table 13 – Text string translation**

D-Bus type	JSON type
"s" – STRING	string

1101

1102

1103

1104

Conversion between D-Bus and JSON strings is simple, as both require their content to be valid Unicode. For example, an implementation can typically do a direct byte copy, as both protocols specify UTF-8 as the encoding of the data, neither constrains the data to a given normalisation format nor specify whether private-use characters or non-characters should be disallowed.

1105

1106

Since the length of D-Bus strings is always known, it is recommended translators not use CBOR indeterminate text strings (first byte 0x7f).

1107

**6.3.2.5 Byte arrays**

1108

The translation of a byte array is direction-specific.

1109

**Table 14 – Byte array translation**

From D-Bus type	To JSON type
"ay" - ARRAY of BYTE	(base64-encoded) string

1110

The base64url encoding is specified in IETF RF 4648 clause 5.

1111

**6.3.2.6 D-Bus variants**

1112

**Table 15 – D-Bus variant translation**

D-Bus type	JSON type
"v" – VARIANT	see clause 6.3.2.6

1113

1114

1115

1116

1117

1118

D-Bus has a type called VARIANT ("v") that is a wrapper around any other D-Bus type. It's a way for the type system to perform type-erasure. JSON, on the other hand, is not type-safe, which means that all JSON values are, technically, variants. The conversion for a D-Bus variant to JSON is performed by entering that variant and encoding the type carried inside as per the rules in this document.

1119

The algorithm must be recursive, as D-Bus variants are allowed to contain variants themselves.

1120 **6.3.2.7 D-Bus object paths and signatures**

1121 The translation of D-Bus object paths and signatures is unidirectional (there is no mapping to them,  
1122 only *from* them). This is shown in Table 16. In the reverse direction, clause 6.3.2.4 always converts  
1123 to D-Bus STRING rather than OBJECT\_PATH or SIGNATURE since it is assumed that “s” is the  
1124 most common string type in use.

1125 **Table 16 – D-Bus object path translation**

From D-Bus type	To JSON type
“o” - OBJECT_PATH	string
“g” – SIGNATURE	

1126  
1127 Both D-Bus object paths and D-Bus type signatures are US-ASCII strings with specific formation  
1128 rules, found in the D-Bus Specification. They are very seldom used and are not expected to be  
1129 found in resources subject to translation without the aid of introspection.

1130 **6.3.2.8 D-Bus structures**

1131 The translation of the types in Table 17 is direction-specific:

1132 **Table 17 – D-Bus structure translation**

From D-Bus type	To JSON type
“r” – STRUCT	array, length > 0

1133  
1134 D-Bus structures can be interpreted as a fixed-length array containing a pre-determined list of types  
1135 for each member. This is how such a structure is mapped to JSON: as an array of heterogeneous  
1136 content, which are the exact members of the D-Bus structure, in the order in which they appear in  
1137 the structure.

1138 **6.3.2.9 Arrays**

1139 The translation of the types in Table 18 is bidirectional:

1140 **Table 18 – Byte array translation**

D-Bus type	JSON type
“ay” - ARRAY of BYTE	(base64-encoded) string – see 6.3.2.5
“ae” - ARRAY of DICT_ENTRY	object – see 6.3.2.10

1141  
1142  
1143 The translation of the types in Table 19 is direction-specific:

1144 **Table 19 – Other array translation**

From D-Bus type	To JSON type
“a” – ARRAY of anything else not specified	array

1146 Aside from arrays of bytes and arrays of dictionary entries, which are mapped to JSON strings and  
 1147 objects respectively, arrays in JSON cannot be constrained to a single type (i.e., heterogeneous  
 1148 arrays). For that reason, strictly speaking all D-Bus arrays excepting arrays of bytes and arrays of  
 1149 dictionary entries must first be converted to arrays of variant “av” and then that array can be  
 1150 converted to JSON. See Table 20.

1151 **Table 20 – JSON array translation**

From JSON type	Condition	To D-Bus type
array	length=0	“av” – ARRAY of VARIANT
array	length>0, all elements of same type	“a” – ARRAY
array	length>0, elements of different types	“r” – STRUCT

1152 Conversion of D-Bus arrays of variants uses the conversion of variants as specified, which simply  
 1153 eliminates the distinction between a variant containing a given value and that value outside a  
 1154 variant. In other words, the elements of a D-Bus array are extracted and sent as elements of the  
 1155 JSON array, as per the other rules of this document.

1156 **6.3.2.10 Dictionaries / Objects**

1157 The choice of “dictionary of STRING to VARIANT” is made because that is the most common type  
 1158 of dictionary found in payloads and is an almost perfect superset of all possible dictionaries in D-  
 1159 Bus anyway. Moreover, it can represent JSON Objects with fidelity, which is the representation that  
 1160 OCF uses in its data models, which in turn means those D-Bus dictionaries will be able to carry  
 1161 with fidelity any OCF JSON Object in current use. See Table 21

1162 **Table 21 – D-Bus dictionary translation**

D-Bus type	JSON type
“a{sv}” - dictionary of STRING to VARIANT	object

1163 D-Bus dictionaries that are not mapping string to variant are first converted to those constraints  
 1164 and then encoded in CBOR.

1165 **6.3.2.11 Non-translatable types**

1166 The types in are not translatable, and the translator should drop the incoming message. None of  
 1167 the types in Table 22 are in current use by either AllJoyn or OCF 1.0 devices, so the inability to  
 1168 translate them should not be a problem.

1169 **Table 22 – Non-translation types**

Type Scope	Type Name	Description
D-Bus	“h”	UNIX_FD (Unix File Descriptor)
JSON	Null	
JSON	undefined	Not officially valid JSON, but some implementations permit it

1170

1171 **6.3.2.12 Examples**

1172 Table 23 and Table 24 provide some translation examples.

**Table 23 – D-Bus to JSON translation examples**

Source D-Bus	JSON Result
BOOLEAN(FALSE)	false
BOOLEAN(TRUE)	true
VARIANT(BOOLEAN(FALSE))	false
VARIANT(BOOLEAN(TRUE))	true
BYTE(0)	0.0
BYTE(255)	255.0
INT16(0)	0.0
INT16(-1)	-1.0
INT16(-32768)	-32768.0
UINT16(0)	0.0
UINT16(65535)	65535.0
INT32(0)	0.0
INT32(-2147483648)	-2147483648.0
INT32(2147483647)	2147483647.0
UINT32(0)	0.0
UINT32(4294967295)	4294967295.0
INT64(0)	0.0
INT64(-1)	-1.0

{"1": 1}	map<STRING, VARIANT>("1" → VARIANT(DOUBLE(1.0)))
{       "rep":       {         "state": false,         "power": 1.0,         "name": "My Light"       }     }	map<STRING, VARIANT>(       {STRING("rep"), VARIANT(map<STRING, VARIANT>(         {STRING("state") →           VARIANT(BOOLEAN(FALSE))},         {STRING("power") → VARIANT(DOUBLE(1.0))},         {STRING("name") → VARIANT(STRING("My           Light"))}       )))     )

1176 NOTE This value cannot be represented with IEEE754 double-precision floating point without loss of information. It is  
 1177 also outside the currently-allowed range of integrals in OCF.

### 1178 6.3.3 Translation with aid of introspection

#### 1179 6.3.3.1 Introduction to Introspection Metadata

1180 When introspection is available, the translator can use the extra metadata provided by the side  
 1181 offering the service to expose a higher-quality reply to the other side. This chapter details  
 1182 modifications to the translation described in the previous chapter when the metadata is found.

1183 Introspection metadata can be used for both translating requests to services and replies from those  
1184 services. When used to translate requests, the introspection is “constraining”, since the translator  
1185 must conform exactly to what that service expects. When used to translate replies, the introspection  
1186 is “relaxing”, but may be used to inform the receiver what other possible values may be encountered  
1187 in the future.

1188 Note that OCF introspection uses JSON types, media attributes, and format attributes, not CBOR  
1189 encoding. The actual encoding of each JSON type is discussed in clause 12.4 of ISO/IEC 30118-  
1190 1:2018 , JSON format attribute values are as defined in JSON Schema Validation, and JSON media  
1191 attribute values are as defined in JSON Hyper-Schema.

#### 1192 **6.3.3.2 Translation of the introspection itself**

1193 Note that both OCF 1.0 and AllJoyn require all services exposed to include introspection metadata,  
1194 which means the translator will need to translate the introspection information on-the-fly for each  
1195 OCF resource or AllJoyn producer it finds. The translator shall preserve as much of the original  
1196 information as can be represented in the translated format. This includes both the information used  
1197 in machine interactions and the information used in user interactions, such as description and  
1198 documentation text.

#### 1199 **6.3.3.3 Variability of introspection data**

1200 Introspection data is not a constant and the translator may find, upon discovering further services,  
1201 that the D-Bus interface or OCF Resource Type it had previously encountered is different than  
1202 previously seen. The translator needs to take care about how the destination side will react to a  
1203 change in introspection.

1204 D-Bus interfaces used by AllJoyn services may be updated to newer versions, which means a given  
1205 type of service may be offered by two distinct versions of the same interface. Updates to  
1206 standardised interfaces must follow strict guidelines established by the AllSeen Interface Review  
1207 Board, mapping each version to a different OCF Resource Type should be possible without much  
1208 difficulty. However, there’s no guarantee that vendor-specific extensions follow those requirements.  
1209 Indeed, there’s nothing preventing two revisions of a product to contain completely incompatible  
1210 interfaces that have the same name and version number.

1211 On the opposite direction, the rules are much laxer. Since OCF specifies optional properties to its  
1212 Resource Types, a simple monotonically-increasing version number like AllJoyn consumer  
1213 applications expect is not possible.

1214 However, it should be noted that services created by the translator by “on-the-fly” translation will  
1215 only be accessed by generic client applications. Dedicated applications will only use “deep binding”  
1216 translation.

#### 1217 **6.3.3.4 Numeric types**

1218 For numeric values, all D-Bus and JSON numeric types are treated equally as source and may all  
1219 be translated into any of the other side’s types. When translating a request to a service, the  
1220 translator need only verify whether there would be loss of information when translating from source  
1221 to destination. For example, when translating the number 1.5 to either a JSON integer or to one of  
1222 the D-Bus integral types, there would be loss of information, in which case the translator should  
1223 refuse the incoming message. Similarly, the value 1,234,567 does not fit the range of a D-Bus byte,  
1224 16-bit signed or unsigned integer.

1225 When translating the reply from the service, the translator shall use the following rules.

1226 Table 25 indicates how to translate from a JSON type to the corresponding D-Bus type, where the  
1227 first matching row shall be used. If the JSON schema does not indicate the minimum value of a  
1228 JSON integer, 0 is the default. If the JSON schema does not indicate the maximum value of a

1229 JSON integer,  $2^{32} - 1$  is the default. The resulting AllJoyn introspection XML shall contain  
 1230 “org.alljoyn.Bus.Type.Min” and “org.alljoyn.Bus.Type.Max” annotations whenever the minimum or  
 1231 maximum, respectively, of the JSON value is different from the natural minimum or maximum of  
 1232 the D-Bus type.

1233

**Table 25 – JSON type to D-Bus type translation**

From JSON type	Condition	To D-Bus Type
integer	minimum $\geq 0$ AND maximum $< 2^8$	“y” (BYTE)
	minimum $\geq 0$ AND maximum $< 2^{16}$	“q” (UINT16)
	minimum $\geq -2^{15}$ AND maximum $< 2^{15}$	“n” (INT16)
	minimum $\geq 0$ AND maximum $< 2^{32}$	“u” (UINT32)
	minimum $\geq -2^{31}$ AND maximum $< 2^{31}$	“i” (INT32)
	minimum $\geq 0$	“t” (UINT64)
		“x” (INT64)
Number		“d” (DOUBLE)
String	pattern = “ $\wedge 0   ([1-9][0-9]\{0,19\})\$$ ”	“t” (UINT64)
	pattern = “ $\wedge 0   (-?[1-9][0-9]\{0,18\})\$$ ”	“x” (INT64)

1234 Table 26 indicates how to translate from a D-Bus type to the corresponding JSON type.

1235

**Table 26 – D-Bus type to JSON type translation**

From D-Bus type	To JSON type	Note
“y” (BYTE)	integer	“minimum” and “maximum” in the JSON schema shall be set to the value of the “org.alljoyn.Bus.Type.Min” and “org.alljoyn.Bus.Type.Max” (respectively) annotations if present, or to the min and max values of the D-Bus type’s range if such annotations are absent.
“n” (UINT16)		
“q” (INT16)		
“u” (UINT32)		
“i” (INT32)		
“t” (UINT64)	integer if org.alljoyn.Bus.Type.Max $\leq 2^{53}$ , else string with JSON pattern attribute “ $\wedge 0   ([1-9][0-9]\{0,19\})\$$ ”.	IETF RFC 7159 clause 6 explains that higher JSON integers are not interoperable.
“x” (INT64)	integer (if org.alljoyn.Bus.Type.Min $\geq -2^{53}$ AND org.alljoyn.Bus.Type.Max $\leq 2^{53}$ ), else string with JSON pattern attribute “ $\wedge 0   (-?[1-9][0-9]\{0,18\})\$$ ”.	IETF RFC 7159 clause 6 explains that other JSON integers are not interoperable.
“d” (double)	number	

1236

1237

1238 **6.3.3.5 Text string and byte arrays**

1239 There's no difference in the translation of text strings and byte arrays compared to clause 6.3.2.  
 1240 Clause 6.3.3 simply lists the JSON equivalent types for the generated OCF introspection. See  
 1241 Table 27.

1242 **Table 27 – Text string translation**

D-Bus Type	JSON type	JSON media attribute, binaryEncoding property
"s" – STRING	string	(none)
"ay" - ARRAY of BYTE	string	base64

1243 In addition, the mapping of the JSON Types in Table 28 is direction-specific:

1244 **Table 28 – JSON UUID string translation**

From JSON type	Condition	To D-Bus Type
string	pattern = " <code>^[a-fA-F0-9]{8}-[a-fA-F0-9]{4}-[a-fA-F0-9]{4}-[a-fA-F0-9]{4}-[a-fA-F0-9]{12}\$</code> "	"ay" – ARRAY of BYTE

1245 JSON strings with any other format value (e.g., date-time, uri, etc.) or pattern value not shown in  
 1246 Table 28 shall be treated the same as if the format and pattern attributes were absent, by simply  
 1247 mapping the value to a D-Bus string.

1248 **6.3.3.6 D-Bus Variants**

1249 If the introspection of an AllJoyn producer indicates a value in a request should be a D-Bus  
 1250 VARIANT, the translator should create such a variant and encode the incoming value as the  
 1251 variant's payload as per the rules in the rest of this document. See Table 29.

1252 **Table 29 – D-Bus variant translation**

D-Bus Type	JSON Type
"v" – VARIANT	see clause 6.3.3.6

1253 **6.3.3.7 D-Bus Object Paths and Signatures**

1254 If the introspection of an AllJoyn producer indicates a value in a request should be a D-Bus Object  
 1255 Path or D-Bus Signature, the translator should perform a validity check in the incoming CBOR Text  
 1256 String. If the incoming data fails to pass this check, the message should be rejected. See Table 30.

1257 **Table 30 – D-Bus object path translation**

From D-Bus Type	To JSON Type
"o" – OBJECT_PATH	string
"g" – SIGNATURE	

1258 **6.3.3.8 D-Bus structures**

1259 D-Bus structure members are described in the introspection XML with the  
 1260 "org.alljoyn.Bus.Struct.*StructureName*.Field.*fieldName*.Type" annotation. The translator shall use  
 1261 the AJSoftwareVersion field of the About data obtained from a bridged AllJoyn producer as follows.  
 1262 When the version of AllJoyn implemented on the Bridged Device is v16.10.00 or greater and the  
 1263 member annotations are present, the translator shall use a JSON object to represent a structure,  
 1264 mapping each member to the entry with that name. The translator needs to be aware that the

1265 incoming CBOR payload may have changed the order of the fields, when compared to the D-Bus  
 1266 structure. When the version of AllJoyn implemented on the Bridged Device is less than v16.10.00,  
 1267 the translator shall follow the rule for translating D-Bus structures without the aid of introspection  
 1268 data.

1269 **6.3.3.9 Arrays and dictionaries**

1270 If the introspection of the AllJoyn interface indicates that the array is neither an ARRAY of BYTE  
 1271 (“ay”) nor an ARRAY of VARIANT (“av”) or that the dictionary is not mapping STRING to VARIANT  
 1272 (“a{sv}”), the translator shall apply the constraining or relaxing rules specified in other clauses.

1273 Similarly, if the OCF introspection indicates a homogeneous array type, the information about the  
 1274 array’s element type should be used as the D-Bus array type instead of VARIANT (“v”).

1275 **6.3.3.10 Other JSON format attribute values**

1276 The JSON format attribute may include other custom attribute types. They are not known at this  
 1277 time, but it is expected that those types be handled by their type and representation alone.

1278 **6.3.3.11 Examples**

1279 Table 31 and Table 32 provide examples using introspection.

1280 **Table 31 – Mapping from AllJoyn using introspection**

AllJoyn Source	AllJoyn Introspection Notes	Translated JSON Payload	OCF Introspection Notes
UINT32 (0)		0	JSON schema should indicate: “type”: “integer”, “minimum”: 0, “maximum”: 4294967295
INT64 (0)		0	Since no Min/Max annotations exist in AllJoyn, JSON schema should indicate: “type”: “string”, “pattern”: “^0 (-?[1-9][0-9]{0,18})\$”
UINT64 (0)		“0”	Since no Max annotation exists in AllJoyn, JSON schema should indicate: “type”: “string”, “pattern”: “^0 ([1-9][0-9]{0,19})\$”
STRING(“Hello”)		“Hello”	JSON schema should indicate: “type”: “string”
OBJECT_PATH(“/”)		“/”	JSON schema should indicate: “type”: “string”
SIGNATURE(“g”)		“g”	JSON schema should indicate: “type”: “string”
ARRAY<BYTE>(0x48, 0x65, 0x6c, 0x6c, 0x6f)		“SGVsbG8”	JSON schema should indicate: “type”: “string”, “media binaryEncoding”: “base64”
VARIANT( <i>anything</i> )		?	JSON schema should indicate:

			"type": [ "boolean", "object", "array", "number", "string", "integer" ]
ARRAY<INT32>()		[]	JSON schema should indicate: "type": "array", "items": { "type": "integer" }
ARRAY<INT64>()		[]	JSON schema should indicate: "type": "array", "items": { "type": "string", "pattern": "^0 ([1-9][0-9]{0,18})\$" }
STRUCT< INT32, INT32>( 0, 1 )	AllJoyn introspection specifies the argument with the annotation: <pre>&lt;struct name="Point"&gt;   &lt;field name="x" type="i" /&gt;   &lt;field name="y" type="i" /&gt; &lt;/struct&gt;</pre>	{"x": 0, "y": 1}	JSON schema should indicate: "type": "object", "properties": { "x": { "type": "integer" }, "y": { "type": "integer" } }

1281

1282

**Table 32 – Mapping from CBOR using introspection**

CBOR Payload	OCF Introspection Notes	Translated AllJoyn	AllJoyn Introspection Notes
0	"type": "integer"	INT32(0)	
0	"type": "integer", "minimum": -240, "maximum": 240	INT64(0)	org.alljoyn.Bus.Type.Min = -240 org.alljoyn.Bus.Type.Max = 240
0	"type": "integer", "minimum": 0, "maximum": 248	UINT64(0)	org.alljoyn.Bus.Type.Max = 248
0.0	"type": "number"	DOUBLE(0.0)	
[1]	JSON schema indicates: "type": "array", "items": { "type": "integer", "minimum": 0, "maximum": 246 }	ARRAY<UINT64>(1)	org.alljoyn.Bus.Type.Max = 246

1283

## 1284 7 Device type definitions

1285 The required Resource Types are listed in Table 33.

1286

**Table 33 – Device type definitions**

Device Name (informative)	Device Type (“rt”) (Normative)	Required Resource name	Required Resource Type
Bridge	oic.d.bridge	Secure Mode	oic.r.securemode
Virtual Device	oic.d.virtual	Device	oic.wk.d

1287

## 8 Resource type definitions

1288

### 8.1 List of resource types

1289

Table 34 lists the Resource Types defined in this document.

1290

**Table 34 – Alphabetical list of resource types**

Friendly Name (informative)	Resource Type (rt)	Clause
AllJoyn Object	oic.r.alljoynobject	8.2
Secure Mode	oic.r.securemode	8.3

1291

1292

### 8.2 AllJoyn Object

1293

#### 8.2.1 Introduction

1294

This resource is a collection of resources that were all derived from the same AllJoyn object.

1295

#### 8.2.2 Example URI

1296

/example/AllJoynObject/

1297

#### 8.2.3 Resource type

1298

The resource type (rt) is defined as: ['oic.r.alljoynobject', 'oic.wk.col'].

1299

## 1551 8.3 Secure Mode

### 1552 8.3.1 Introduction

1553 This resource describes a secure mode on/off feature (on/off).

1554 A secureMode value of 'true' means that the feature is on, and any Bridged Server that cannot be  
1555 communicated with securely shall not have a corresponding Virtual OCF Server, and any Bridged  
1556 Client that cannot be communicated with securely shall not have a corresponding Virtual OCF  
1557 Client.

1558 A secureMode value of 'false' means that the feature is off, any Bridged Server can have a  
1559 corresponding Virtual OCF Server, and any Bridged Client can have a corresponding Virtual OCF  
1560 Client.

### 1561 8.3.2 Example URI

1562 /example/SecureModeResURI

### 1563 8.3.3 Resource type

1564 The resource type (rt) is defined as: ['oic.r.securemode'].
