1 Scope

The OCF Core specifications are divided into a series of documents:

- Core specification: The Core specification document specifies the Framework, i.e., the OCF core architecture, interfaces, protocols and services to enable OCF profiles implementation for Internet of Things (IoT) usages and ecosystems. This document is mandatory for all Devices to implement.

- Core optional specification (this document): The Core optional specification document specifies the Framework, i.e., the OCF core architecture, interfaces, protocols and services to enable OCF profiles implementation for Internet of Things (IoT) usages and ecosystems that can optionally be implemented by any Device.

- Core extension specification(s): The Core extension specification(s) document(s) specifies optional OCF Core functionality that are significant in scope (e.g., Wi-Fi easy setup, Cloud).

2 Normative references

The following documents, in whole or in part, are normatively referenced in this document and are indispensable for its application. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

3 Terms, definitions, and abbreviated terms

3.1 Terms and definitions

For the purposes of this document, the terms and definitions given in ISO/IEC 30118-1:2018. ISO/IEC 30118-2:2018, and the following apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

3.1.1 Alert

information provided by the Device by means of a specialised Resource Type that provides details with regard to potential problems, issues, or Device status of interest on which action can be taken

3.1.2 Scene

a static entity that stores a set of defined Property values for a Collection of Resources

Note 1 to entry: A Scene (3.1.2) is a prescribed setting of a set of Resources with each having a predetermined value for the Property that has to change.

3.1.3 Scene Collection

a Collection that contains an enumeration of possible Scene Values (3.1.5) and the current Scene Value (3.1.5)

Note 1 to entry: The member values of the Scene Collection (3.1.3) are Scene Members (3.1.4).

3.1.4 Scene Member

a Resource that contains mappings of Scene Values (3.1.5) to values of a Property in the Resource

3.1.5 Scene Value

a Scene (3.1.2) enumerator representing the state in which a Resource can be

4 Document conventions and organization

4.1 Conventions

In this document a number of terms, conditions, mechanisms, sequences, parameters, events, states, or similar terms are printed with the first letter of each word in uppercase and the rest lowercase (e.g., Network Architecture). Any lowercase uses of these words have the normal technical English meaning.

4.2 Notation

In this document, features are described as required, recommended, allowed or DEPRECATED as follows:

Required (or shall or mandatory)(M).

– These basic features shall be implemented to comply with Core Architecture. The phrases "shall not", and "PROHIBITED" indicate behaviour that is prohibited, i.e. that if performed means the implementation is not in compliance.

Recommended (or should)(S).
These features add functionality supported by Core Architecture and should be implemented. Recommended features take advantage of the capabilities Core Architecture, usually without imposing major increase of complexity. Notice that for compliance testing, if a recommended feature is implemented, it shall meet the specified requirements to be in compliance with these guidelines. Some recommended features could become requirements in the future. The phrase "should not" indicates behaviour that is permitted but not recommended.

Allowed (may or allowed)(O).

These features are neither required nor recommended by Core Architecture, but if the feature is implemented, it shall meet the specified requirements to be in compliance with these guidelines.

DEPRECATED.

Although these features are still described in this document, they should not be implemented except for backward compatibility. The occurrence of a deprecated feature during operation of an implementation compliant with the current document has no effect on the implementation's operation and does not produce any error conditions. Backward compatibility may require that a feature is implemented and functions as specified but it shall never be used by implementations compliant with this document.

Conditionally allowed (CA).

The definition or behaviour depends on a condition. If the specified condition is met, then the definition or behaviour is allowed, otherwise it is not allowed.

Conditionally required (CR).

The definition or behaviour depends on a condition. If the specified condition is met, then the definition or behaviour is required. Otherwise the definition or behaviour is allowed as default unless specifically defined as not allowed.

Strings that are to be taken literally are enclosed in "double quotes".

Words that are emphasized are printed in italic.

In all of the Property and Resource definition tables that are included throughout this document the "Mandatory" column indicates that the item detailed is mandatory to implement; the mandating of inclusion of the item in a Resource Payload associated with a CRUDN action is dependent on the applicable schema for that action.

Data types

Resources are defined using data types derived from JSON values as defined in clause 4.3 in ISO/IEC 30118-1:2018.

Functional interactions

Introduction

The functional interactions between a Client and a Server are described in 5.2 through 5.6 respectively. The functional interactions use CRUDN messages (clause 8 in ISO/IEC 30118-1:2018) and include Discovery, Notification, and Device management. These functions require support of core defined Resources as defined in Table 1.

Table 1 – List of optional Core Resources

<table>
<thead>
<tr>
<th>Pre-defined URI</th>
<th>Resource Name</th>
<th>Resource Type</th>
<th>Related Functional Interaction</th>
<th>Mandatory</th>
</tr>
</thead>
<tbody>
<tr>
<td>(none)</td>
<td>Configuration</td>
<td>&quot;oic.wk.con&quot;</td>
<td>Device management</td>
<td>No</td>
</tr>
</tbody>
</table>
5.2 Onboarding, provisioning and configuration

Onboarding and provisioning are fully defined by the ISO/IEC 30118-2:2018.

Should a Device support Client update of configurable information it shall do so via exposing an "oic.wk.con" Core Resource (Table 2) in "/oic/res".

Table 2 – Configuration Resource

<table>
<thead>
<tr>
<th>Example URI</th>
<th>Resource Type Title</th>
<th>Resource Type ID (&quot;rt&quot; value)</th>
<th>OCF Interfaces</th>
<th>Description</th>
<th>Related Functional Interaction</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;/example/oic/con&quot;</td>
<td>Device configuration</td>
<td>&quot;oic.wk.con&quot;</td>
<td>&quot;oic.if.rw&quot;</td>
<td>The Resource Type through which configurable information specific to the Device is exposed. The Resource Properties exposed in &quot;oic.wk.con&quot; are listed in Table 3.</td>
<td>Configuration</td>
</tr>
<tr>
<td>&quot;/example/oic/con&quot;</td>
<td>Platform configuration</td>
<td>&quot;oic.wk.con.p&quot;</td>
<td>&quot;oic.if.rw&quot;</td>
<td>The optional Resource Type through which configurable information specific to the Platform is exposed. The Properties exposed in &quot;oic.wk.con.p&quot; are listed in Table 4.</td>
<td>Configuration</td>
</tr>
</tbody>
</table>

Table 3 defines the "oic.wk.con" Resource Type.

Table 3 – "oic.wk.con" Resource Type definition

<table>
<thead>
<tr>
<th>Property title</th>
<th>Property name</th>
<th>Value type</th>
<th>Value rule</th>
<th>Unit</th>
<th>Access mode</th>
<th>Mandatory</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>(Device) Name</td>
<td>&quot;n&quot; (Common Property of &quot;/example/oic/con&quot;)</td>
<td>&quot;string&quot;</td>
<td>N/A</td>
<td>N/A</td>
<td>R, W</td>
<td>Yes</td>
<td>Human friendly name configurable by the end user (e.g. Bob's thermostat). The &quot;n&quot; Common Property of the oic.wk.con Core Resource and the &quot;n&quot; Common Property of the &quot;/oic/d&quot; Core Resource shall have the same Value. When the &quot;n&quot; Common Property Value of the oic.wk.con Core Resource is modified, it shall be reflected to...</td>
</tr>
</tbody>
</table>
| Location Name | "locn" | "string" | N/A | N/A | R,W | No | Human friendly name for location  
For example, "Living Room".
| Currency | "c" | "string" | N/A | N/A | R,W | no | Indicates the currency that is used for any monetary transactions.
| Region | "r" | "string" | N/A | N/A | R,W | no | Free form text indicating the current region in which the Device is located geographically.
| Localized Names | "ln" | "array" | N/A | N/A | R,W | no | Human-friendly name of the Device, in one or more languages. This Property is an array of objects where each object has a "language" field (containing an IETF RFC 5646 language tag) and a "value" field containing the Device name in the indicated language. If this Property and the Device Name (n) Property are both supported, the Device Name (n) value shall be included in this array.
| Default Language | "dl" | "language-tag" | N/A | N/A | R,W | no | The default language supported by the Device, specified as an IETF RFC 5646 language tag. By default, clients can treat any string Property as being in this language unless the Property specifies otherwise.

Table 4 defines the "oic.wk.con.p" Resource Type.

Table 4 – "oic.wk.con.p" Resource Type definition

<table>
<thead>
<tr>
<th>Property title</th>
<th>Property name</th>
<th>Value type</th>
<th>Value rule</th>
<th>Unit</th>
<th>Access mode</th>
<th>Mandatory</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<td>&quot;mnpn&quot;</td>
<td>&quot;array&quot;</td>
<td>N/A</td>
<td>N/A</td>
<td>R,W</td>
<td>No</td>
<td>Friendly name of the Platform. This Property is an array of objects where each object has a &quot;language&quot; field (containing an IETF RFC 5646 language tag) and a &quot;value&quot; field containing the platform friendly name in the indicated language. For example,</td>
</tr>
</tbody>
</table>
5.3 Device management

5.3.1 Overview
Device management includes the following functions:

– Diagnostics and maintenance
– Network monitoring

5.3.2 Diagnostics and maintenance Resource Type

The Diagnostics and Maintenance Resource Type is intended to enable the resolution of issues encountered with the Devices while operating in the field. If diagnostics and maintenance is supported by a Device, the Core Resource "/oic/mnt" shall be supported as described in Table 5.

Table 5 – Optional diagnostics and maintenance Device management Core Resources

<table>
<thead>
<tr>
<th>Pre-defined URI</th>
<th>Resource Type Title</th>
<th>Resource Type ID (&quot;rt&quot; value)</th>
<th>OCF Interfaces</th>
<th>Description</th>
<th>Related Functional Interaction</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;/oic/mnt&quot;</td>
<td>Maintenance</td>
<td>&quot;oic.wk.mnt&quot;</td>
<td>&quot;oic.if.rw&quot;</td>
<td>The Resource through which the Device is maintained and can be used for diagnostic purposes. The Properties exposed by &quot;/oic/mnt&quot; are listed in Table 6.</td>
<td>Device management</td>
</tr>
</tbody>
</table>

Table 6 defines the "oic.wk.mnt" Resource Type. At least one of the Factory_Reset, Reboot, or last error Properties shall be implemented.

Table 6 – "oic.wk.mnt" Resource Type definition

<table>
<thead>
<tr>
<th>Property title</th>
<th>Property name</th>
<th>Value type</th>
<th>Value rule</th>
<th>Unit</th>
<th>Access mode</th>
<th>Mandatory</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Factory_Reset</td>
<td>&quot;fr&quot;</td>
<td>&quot;boolean&quot;</td>
<td>N/A</td>
<td>N/A</td>
<td>R, W</td>
<td>No</td>
<td>When writing to this Property: false – No action (Default) true – Start Factory Reset When reading this Property, a value of true indicates a pending factory reset. Once the factory reset has been completed, the Device shall set the value back to false. This Property is functionally equivalent to a transition to a state of Hard Reset as defined in ISO/IEC 30118-2:2018, clause 8.1</td>
</tr>
<tr>
<td>Reboot</td>
<td>&quot;rb&quot;</td>
<td>&quot;boolean&quot;</td>
<td>N/A</td>
<td>N/A</td>
<td>R, W</td>
<td>No</td>
<td>When writing to this Property: false – No action (Default) true – Start Reboot After Reboot, this value shall be changed back to</td>
</tr>
</tbody>
</table>
Last error | "err" | "integer" | HTTP error code | N/A | R | No | Last occurred error code, shall be cleared to 503 (service unavailable), when doing a Factory Reset or Reboot. All HTTP errors outside the 100, 200 or 300 range shall be stored.

NOTE Default indicates the value of this Property as soon as the Device is rebooted or factory reset.

5.3.3 Core behaviours on Device maintenance state changes

5.3.3.1 Overview

As defined in ISO/IEC 30118-2:2018 a Device has a state machine through which it transitions during its operational lifetime.

ISO/IEC 30118-2:2018 details actions on such state transitions for the Resources defined therein. This clause defines the actions to be taken on such state transitions for the Resources and functionality defined within this document.

The state transitions to be considered are:

- RFNOP to Soft Reset
- RFNOP to Hard Reset
- RFNOP to RFPRO
- RFPRO to RFNOP

Table 7 provides a summary of the actions to be taken in each case.

<table>
<thead>
<tr>
<th>Table 7 – Actions on Device state change</th>
</tr>
</thead>
<tbody>
<tr>
<td>SVR</td>
</tr>
<tr>
<td>Mandatory Core Resources</td>
</tr>
<tr>
<td>Optional Core Resources</td>
</tr>
<tr>
<td>Vertical Resources</td>
</tr>
<tr>
<td>Created Resources</td>
</tr>
<tr>
<td>Observe Transactions</td>
</tr>
<tr>
<td>OCF Cloud</td>
</tr>
</tbody>
</table>
5.3.3.2 Handling of Observe transactions

On a transition to hard reset all active Observe transactions shall be cancelled by the Server by sending a "Service Unavailable" response on each active Observe transaction.

On a state transition that allows for modification of the access controls that exist against a Resource (such as from RFPRO to RFNOP) it is possible that the access controls themselves as defined within the ISO/IEC 30118-2:2018 are changed such that the original RETRIEVE operation that established the Observe would not have been allowed. In such instances the Server shall cancel the Observe by sending a "Service Unavailable" response on the Observe transaction.

5.3.3.3 Reset of Resource Properties to defined defaults

5.3.3.3.1 Overview

On a hard or factory reset Resource Properties are reset to default values. These are commonly referred to as manufacturer defaults however it is not possible in all instances to revert to such values as they may not be known or be practicable.

The default values to be applied for the mandatory and optional Core Resources, plus any Vertical Resources are defined in clauses 5.3.3.3.2 through 5.3.3.3.4 respectively.

5.3.3.3.2 Defaults for Vertical Resources

Default values for any Vertical Resources exposed by a Device are up to the implementation.

5.3.3.3.3 Defaults for mandatory Core Resources

Table 8 and Table 9 capture default values that shall be set for mandatory Properties of the mandatory Core Resources where those Resources contain Properties that can be changed by a Client. This excludes "/oic/res" as that has no mutable Properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Default</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;n&quot;</td>
<td>&quot;</td>
<td>Empty string if &quot;/oic/con&quot; is also exposed, otherwise not mutable.</td>
</tr>
<tr>
<td>&quot;icv&quot;</td>
<td>Unchanged</td>
<td>Not mutable</td>
</tr>
<tr>
<td>&quot;dmv&quot;</td>
<td>Unchanged</td>
<td>Not mutable</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Property</th>
<th>Default</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;mnmn&quot;</td>
<td>Unchanged</td>
<td>Not mutable</td>
</tr>
</tbody>
</table>

5.3.3.3.4 Defaults for optional Core Resources

This clause details the actions to be taken with respect to the optional Core Resources.

The icon Resource ("oic.r.icon") has no mutable Properties, so no action is to be taken.
Any Resources that were added to an instance of a Collection or a specialisation of a Collection (e.g. Scene List ("oic.wk.scenelist") or Scene Collection ("oic.wk.scenecollection")) by a Client shall be deleted.

The Device configuration Resource ("oic.wk.con") shall be modified in accordance with Table 10 for those Properties that are implemented.

### Table 10 – Default values for Device configuration Resource

<table>
<thead>
<tr>
<th>Property</th>
<th>Default</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;loc&quot;</td>
<td>[0.0,0.0]</td>
<td></td>

<tr>
<td>&quot;dl&quot;</td>
<td>Defined by the manufacturer</td>
<td>Recommend the primary language tag for the region into which the Device is marketed (e.g. &quot;en&quot; for primarily English speaking countries).</td>
</tr>
</tbody>
</table>

5.3.3.4 Handling of OCF Cloud

On a hard reset the Device if registered to an OCF Cloud shall de-register from the OCF Cloud in accordance with the procedures in the ISO/IEC 30118-2:2018, clause 13.10.

Further, on a hard reset the CoAPCloudConf Resource ("oic.r.coapcloudconf") shall be modified in accordance with Table 11 for those Properties that are implemented.

### Table 11 – Default values for CoAPCloudConf Resource

<table>
<thead>
<tr>
<th>Property</th>
<th>Default</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;apn&quot;</td>
<td>&quot;&quot;</td>

<tr>
<td>&quot;cis&quot;</td>
<td>&quot;coaps+tcp://127.0.0.1&quot;</td>
<td>Or other valid but non-resolving URI.</td>
</tr>
<tr>
<td>&quot;at&quot;</td>
<td>&quot;&quot;</td>
<td>Empty string, only if no manufacturer default exists, in which case it reverts to that default or is unchanged.</td>
</tr>
<tr>
<td>&quot;sid&quot;</td>
<td>Temporary not repeated value or &quot;00000000-0000-0000-0000-000000000000&quot;</td>
<td></td>
</tr>
<tr>
<td>&quot;clec&quot;</td>
<td>0</td>
<td>No error.</td>
</tr>
</tbody>
</table>

5.3.4 Network monitoring Resource Type

Network monitoring is used for monitoring the current network state of the Device.

The network monitoring Resource Type is "oic.wk.nmon" and is described in Table 12. The Resource Type may occur multiple times if more than 1 network interface is implemented. The Common Property "n" may be used to distinguish the different network interfaces, like distinguish the 2.4 and 5G Wi-Fi network interfaces.

Average message size -rx
“amsrx” “integer” bytes bytes R No Average received message size e.g AVT(rx) in the collection period.

Examples of typical used values for ianaifType are 71 (ieee80211) for Wi-Fi and 6 (ethernetCsmacd) for Ethernet.

A Device should start collecting network monitoring data when receiving an UPDATE operation with the parameter "col" = true. A Device should stop collecting network data when receiving an UPDATE operation with parameter "col" = false. The collected network data should be reset when an UPDATE operation with parameter "reset" = true is received, if the parameter "reset" is false then the values should not be reset. Figure 1 illustrates the interactions with the network monitoring Resource.
The state transition diagram for collecting or not collecting network information is described by Figure 2.
5.3.5 Software update Resource Type

The software update Resource is used to control software updates of the Device.

In ISO/IEC 30118-2:2018 there is already a manual triggered software update mechanism available. The triggering of the Client (manual) software update is achieved via the security Resource Type "oic.r.pstat" by using the appropriate bits in the "tm" Property. The software update triggering results in updates of the "cm" Property in the "oic.r.pstat" Resource Type (see ISO/IEC 30118-2:2018 clause 13.8). The software update Resource adds additional features to the security specified mechanism, like:

- Specify the source to obtain the software package.
- Time scheduled software update actions.
- Status information, especially more info about various error situations.

If the Device implements the software update Resource, it is required to implement the software update behaviour to actually update the software of the Device as indicated by the "oic.r.pstat" "cm" bits as defined in ISO/IEC 30118-2:2018 clause 13.8. Also the security defined software update process shall use the data that is set on the software update Resource like the "purl" Property.

The software update Resource Type is "oic.r.softwareupdate" and is described in Table 14.

Table 14 – Optional software update Resources

</tr>
<tr>
<td>Software version validation (during downloading and checking the software integrity)</td>
<td>&quot;svv&quot;</td>
<td>Bit 64 = 0 Bit 128 = 0 Bit 256 = 1</td>
<td>&quot;idlev&quot;, &quot;nsa&quot;, &quot;sva&quot;, &quot;upgrading&quot;</td>
</tr>
</tbody>
</table>
The typical state transitions are described Figure 3. The state transitions can be triggered manually or by a timed action. The manual state triggers (i.e., "tm" Property of "oic.r.pstat") are described in ISO/IEC 30118-2:2018 clause 13.8. The timed state triggers are managed using the "swupdateaction" and "updatetime" Properties of the software update Resource to trigger software update actions at some future date and time. The action names for scheduled actions are listed in Table 17. When the "updatetime" for the timed action is in the past then the update shall not take place, it is implementation dependent if the UPDATE with an "updatetime" value in the past will give an error on the UPDATE operation.

### Table 17 Value definitions for the Property "swupdateaction"

<table>
<thead>
<tr>
<th>Description</th>
<th>Value of Property &quot;swupdateaction&quot;, for scheduled update actions.</th>
<th>Action taken</th>
<th>Equivalent &quot;pstat&quot; &quot;tm&quot; bits.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Nothing scheduled (not applicable).</td>
<td>&quot;idle&quot;</td>
<td>No action</td>
<td>&quot;tm&quot; bit 256.</td>
</tr>
<tr>
<td>Initiate software availability check.</td>
<td>&quot;isac&quot;</td>
<td>Check on remote end point if a newer software version is available.</td>
<td>&quot;tm&quot; bit 256.</td>
</tr>
<tr>
<td>Initiate software version validation.</td>
<td>&quot;isvv&quot;</td>
<td>Downloads and verifies if the software version is valid.</td>
<td>&quot;tm&quot; bit 64.</td>
</tr>
<tr>
<td>Initiate secure software update.</td>
<td>&quot;upgrade&quot;</td>
<td>Upgrades the software in the Device. It uses the downloaded and validated software package. If no validated software package is available on the Device, the Device takes the necessary steps to obtain a validated software package, by downloading and verifying the software from the external source.</td>
<td>&quot;tm&quot; bit 128.</td>
</tr>
</tbody>
</table>

The "purl" Property indicates the URL to obtain the software package from. This URL shall be a fully qualified URL. If the value is an empty string (""), then the Device will use the built in vendor defined URL (see ISO/IEC 30118-2:2018). If a built in URL is not implemented, setting the "purl" Property value to an empty string will result in an error code value of 6 as defined in Table 18.
Table 18 List of codes of the "swupdateresult" Property.

Figure 4 depicts a typical update scenario. This scenario is using the observability of "pstat", so that the Client is informed on the changes of the "cm" bit value to track the progress.
5.4 Scenes

5.4.1 Introduction

Scenes are a mechanism for automating certain operations.

A Scene is a static entity that stores a set of defined Property values for a Collection of Resources. Scenes provide a mechanism to store a setting over multiple Resources that may be hosted by multiple separate Servers. Scenes, once set up, can be used by multiple Clients to recall a setup.

Scenes can be grouped and reused, a group of Scenes is also a Scene.

In short, Scenes are bundled user settings.

5.4.2 Scenes Resource model

5.4.2.1 Introduction

Scenes are described by means of Resources. The Scene Resources are hosted by a Server and the top level Resource is listed in "/oic/res". This means that a Client can determine if the Scene functionality is hosted on a Server via Resource discovery as defined in clause 11.2 in ISO/IEC 30118-1:2018. The setup of Scenes is driven by Client interactions. This includes creating new Scenes, and mappings of Server Properties that are part of a Scene.

The Scene functionality is created by multiple Resources and has the structure depicted in Figure 5. The sceneList and sceneCollection Resources are overloaded Collection Resources. The sceneCollection Resource contains a list of Scenes. This list contains zero or more Scenes. The sceneMember Resource contains the mapping between a Scene and what needs to happen according to that Scene on an indicated Resource.

```
sceneList
  sceneCollection A
    scenemember A1
    scenemember A2
    ...
    scenemember Ax
  ...
  sceneCollection Z
    scenemember Z1
    scenemember Z2
    ...
    scenemember Zx
```

5.4.2.2 Scene creation

A Client desiring to interact with Scenes needs to first determine if the Server supports the Scene feature; the sceneMembers of a Scene that are Resources of end Device being updated by the Scene change do not have to be co-located on the Server supporting the Scene feature. This can be done by checking if "/oic/res" contains the "rt" of the sceneList Resource. This is depicted in first steps of Figure 6. The sceneCollection Resource is created by the Server using some out of bound mechanism, Client creation of Scenes is not supported at this time. This will entail defining the Scene with an applicable list of Scene Values and the mappings for each Resource being part of the Scene. The mapping for each Resource being part of the sceneCollection Resource is described by a Resource called sceneMember. The sceneMember Resource contains the link to a
Resource and the mapping between the Scene listed in the "sceneValues" Property and the actual Property value of the Resource indicated by the Link.

5.4.2.3 Interacting with Scenes

All capable Clients can interact with Scenes. The allowed Scene Values and the last applied Scene Value can be retrieved from the Server hosting the Scene. The Scene Value shall be changed by issuing an UPDATE operation with a payload that sets the "lastScene" Property to one of the listed allowed Scene Values. These steps are depicted in Figure 7. Note that the "lastScene" Property value does not imply that the current state of all Resources that are part of the Scene will be at the mapped value. This is due to that the setting the Scene Values are not modelled as actual states of the system. This means that another Client can change just one Resource being part of the Scene without having feedback that the state of the Scene is changed.

Figure 6 – Interactions to check Scene support and setup of specific Scenes
As described previously, a Scene can reference one or more Resources (i.e., sceneMembers) that are present on one or more Servers. The Scene Members are re-evaluated each time a Scene change takes place. This evaluation is triggered by a Client that is either embedded as part of the Server hosting the Scene, or separate to the Server having knowledge of the Scene via a RETRIEVE operation. Observing the referenced Resources using the mechanism described in clause 11.3.2 in ISO/IEC 30118-1:2018. The embedded Client located in the same Device with the Server is a general Client but interacts only with Scene functionalities. During the evaluation the mappings for the new Scene Value will be applied to the Servers which contain sceneMembers from the Scene that is being updated. This behaviour is depicted in Figure 8.
5.4.2.4 Summary of Resource Types defined for Scene functionality

Table 19 summarizes the list of Resource Types that are part of Scenes.

<table>
<thead>
<tr>
<th>Friendly Name (informative)</th>
<th>Resource Type (rt)</th>
<th>Short Description</th>
<th>Clause</th>
</tr>
</thead>
<tbody>
<tr>
<td>sceneList</td>
<td>&quot;oic.wk.scenelist&quot;</td>

<td>Description of zero or more scenes</td>
<td>N/A</td>
</tr>
<tr>
<td>sceneMember</td>
<td>&quot;oic.wk.scenemember&quot;</td>
<td>Description of mappings for each specific Resource part of the sceneCollection</td>
<td>N/A</td>
</tr>
</tbody>
</table>

5.4.3 Security considerations

Creation of Scenes on a Server that is capable of this functionality is dependent on the ACLs applied to the Resources and the Client having the appropriate permissions. Interaction between a Client (embedded or separate) and a Server that hosts the Resource that is referenced as a Scene Member is contingent on the Client having appropriate permissions to access the Resource on the host Server.
See ISO/IEC 30118-2:2018 for details on the use of ACLs and also the mechanisms around Device Authentication that are necessary to ensure that the correct permissions exist for the Client to access the Scene Member Resource(s) on the Server.

5.5 Icons

5.5.1 Overview

Icons are a primitive that are needed by various OCF subsystems, such as bridging. An optional Resource Type of "oic.r.icon" has been defined to provide a common representation of an icon Resource that can be used by Devices.

5.5.2 Resource

The icon Resource is as defined in Table 20.

Table 20 – Optional Icon Core Resource

</tbody>
</table>

5.6 Alerts

5.6.1 Overview

Alerts provide a means by which a Device provides information to an interested party with regard to error or other conditions that the Device is experiencing. An Alert contains human readable text that is dependent on the Device itself and the condition being reported. A Device may expose discrete instances of an Alert Resource Type ("oic.r.alert") or may also expose Alerts within an Alert Collection ("oic.r.alertcollection"). If the instance of "oic.r.alertcollection" is Observable (see clause 7.8.2.2.2 in ISO/IEC 30118-1:2018) then a Client may Observe the Collection using the default invocation pattern provided by the OCF Interface.
mechanisms defined in clause 11.3 in ISO/IEC 30118-1:2018. As the Device adds and removes Alerts from the Collection notifications may be generated for any registered Observers, the format of which is dependent upon the OCF Interface used for the initial Observe, see clause 7.6.3 in ISO/IEC 30118-1:2018.

5.6.2 Resource Types

The Alert and Alert Collection Resource Types are as defined in Table 22.

<table>
<thead>
<tr>

</tbody>
</table>
The Alert Collection ("oic.r.alertcollection") Resource Type defines no Properties additional to those defined for all instances of a Collection in Table 13 of ISO/IEC 30118-1:2018. However the Alert Collection does impose restrictions of the values that shall be populated in the "rt" and "rts" Properties. These are described in Table 24.

</tr>
</tbody>
</table>

5.6.3 Example of Use

Consider a Device that is capable of generating Alerts; it exposes an empty instance of an Alert Collection ("oic.r.alertcollection"); that is the array of Links (the "links" Property) contains no items.

As the Device under whatever conditions generates Alerts, the Device adds a Link to the Alert Resource in the instance of an Alert Collection. A Client that has discovered the Device and is Observing the Alert Collection using the links list OCF Interface ("oic.if.ll") will receive a notification containing the complete Alert Collection (not just any Links that were added). It is the responsibility of the Client to determine which Links were added (or removed if the Alert was removed); noting that the "generatedtime" Property may be used to determine the generated order. The Client then retrieves the Alert itself via a RETRIEVE to the "href" Link Parameter in the newly added Link to the Collection.

See A.10 for an example of an Alert Resource and the applicable schema.
Annex A
(normative)

Resource Type definitions

A.1 List of Resource Type definitions

All the clauses in Annex A describe the Resource Types with a RESTful API definition language. The Resource Type definitions presented in Annex A are formatted for readability, and so may appear to have extra line breaks. Table A.1 contains the list of defined Core Common Resources in this document.

### A.5 Maintenance

#### A.5.1 Introduction

The Resource through which a Device is maintained and can be used for diagnostic purposes.

- fr (Factory Reset) is a boolean.
  - The value 0 means No action (Default), the value 1 means Start Factory Reset
  - After factory reset, this value shall be changed back to the default value

- rb (Reboot) is a boolean.
  - The value 0 means No action (Default), the value 1 means Start Reboot
  - After Reboot, this value shall be changed back to the default value

#### A.5.2 Well-known URI

/oic/mnt

#### A.5.3 Resource type

The Resource Type is defined as: "oic.wk.mnt".

#### A.5.4 OpenAPI 2.0 definition

```json
{

A.8 Scene Collection

A.8.1 Introduction

Collection that models a set of Scenes.
This Resource is a generic Collection Resource with additional Properties.
The rts value contains oic.scenemember Resource Types.
The additional Properties are
lastScene, this is the Scene Value last set by any Client
sceneValues, this is the list of available Scenes
lastScene shall be listed in sceneValues.

A.8.2 Example URI

/SceneCollectionResURI

A.8.3 Resource type

The Resource Type is defined as: "oic.wk.scenecollection".

A.8.4 OpenAPI 2.0 definition

#### A.10 Alert

**A.10.1 Introduction**

This Resource provides a mechanism for a Server to expose information to an interested party with regard to error or other conditions that the Device is experiencing (Alerts).

- **category** is a string that contains the Device defined category for the Alert.
- **timestamp** is an RFC3339 formatted time at which the Alert was generated.
- **originatorid** is a string that contains the identity of the originator of the Alert.
- **severity** is an integer that contains the RFC5424 defined severity of the Alert.
- **subject** is an array containing human readable text in one or more languages.
- **accountid** is a string containing the identity of the account with which the Device is associated.

**A.10.2 Example URI**

/AlertResURI
A.10.3 Resource type

The Resource Type is defined as: "oic.r.alert".

### A.12.5 Property definition

Table A.22 defines the Properties that are part of the "oic.r.softwareupdate" Resource Type.

<table>
<thead>
<tr>
<th>Property name</th>
<th>Value type</th>
<th>Mandatory</th>
<th>Access mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rt</td>
<td>array: see schema</td>
<td>No</td>
<td>Read Only</td>
<td>New available Software version</td>
</tr>
<tr>
<td>nv</td>
<td>string</td>
<td>No</td>
<td>Read Only</td>
<td>New available Software version</td>
</tr>
<tr>
<td>purl</td>
<td>string</td>
<td>Yes</td>
<td>Read Write</td>
<td>Source of the software package, might be a HTTPS or CoAPs URL</td>
</tr>
<tr>
<td>swupdateaction</td>
<td>string</td>
<td>Yes</td>
<td>Read Write</td>
<td>Scheduled action to do a software update</td>
</tr>
<tr>
<td>swupdatestate</td>
<td>string</td>
<td>Yes</td>
<td>Read Only</td>
<td>State of the software update</td>
</tr>
<tr>
<td>swupdateresult</td>
<td>integer</td>
<td>Yes</td>
<td>Read Only</td>
<td>Result of the software update, list of result codes</td>
</tr>
<tr>
<td>lastupdate</td>
<td>string</td>
<td>No</td>
<td>Read Only</td>
<td>Time of the last software update (in RFC3339 format), Initial set on date of manufacturing</td>
</tr>
<tr>
<td>signed</td>
<td>string</td>
<td>No</td>
<td>Read Only</td>
<td>Signage method of the software package, currently the only allowed value is 'vendor'.</td>
</tr>
<tr>
<td>updatetime</td>
<td>string</td>
<td>Yes</td>
<td>Read Write</td>
<td>Scheduled time (in RFC3339 format) to do action which is specified in 'swupdateaction' Property.</td>
</tr>
<tr>
<td>n</td>
<td>multiple types: see schema</td>
<td>No</td>
<td>Read Write</td>
<td></td>
</tr>
<tr>
<td>id</td>
<td>multiple types: see schema</td>
<td>No</td>
<td>Read Write</td>
<td></td>
</tr>
<tr>
<td>if</td>
<td>array: see schema</td>
<td>No</td>
<td>Read Only</td>
<td>The interface set supported by this resource</td>
</tr>
<tr>
<td>purl</td>
<td>multiple types: see schema</td>
<td>Yes</td>
<td>Read Write</td>
<td></td>
</tr>
<tr>
<td>swupdateaction</td>
<td>multiple types: see schema</td>
<td>Yes</td>
<td>Read Write</td>
<td></td>
</tr>
<tr>
<td>updatetime</td>
<td>multiple types: see schema</td>
<td>Yes</td>
<td>Read Write</td>
<td></td>
</tr>
</tbody>
</table>

### A.12.6 CRUDN behaviour

Table A.23 defines the CRUDN operations that are supported on the "oic.r.softwareupdate" Resource Type.
Table A.23 – The CRUDN operations of the Resource with type "rt" = "oic.r.softwareupdate".

<table>
<thead>
<tr>
<th>Create</th>
<th>Read</th>
<th>Update</th>
<th>Delete</th>
<th>Notify</th>
</tr>
</thead>
<tbody>
<tr>
<td>get</td>
<td>post</td>
<td></td>
<td></td>
<td>observe</td>
</tr>
</tbody>
</table>
