1 Scope

This document provides detailed mapping information between BLE (Bluetooth Low Energy) and OCF defined Resources.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

Adopted Bluetooth Profiles, Services, Protocols and Transports

Derived Models for Interoperability between IoT Ecosystems, Stevens & Merriam, March 2016

IETF RFC 4122, A Universally Unique IDentifier (UUID) URN Namespace, July 2005
https://www.rfc-editor.org/info/rfc4122

3 Terms, definitions, symbols and abbreviated terms

3.1 Terms and definitions

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at https://www.iso.org/obp

3.1.1
GATT-based Profile
a BLE profile using procedures and operating models provided by GATT profile

3.2 Abbreviated terms

3.2.1
ATT
ATTribute protocol
ATT is a protocol for discovering, reading, and writing attributes on a peer device (Vol 3, part F of Bluetooth Core Specification 4.0)

3.2.2
GAP
Generic Access Profile
GAP defines the generic procedures related to discovery of Bluetooth devices (idle mode procedures) and link management aspects of connecting to Bluetooth devices (connecting mode procedures). It also defines procedures related to use of different security levels. In addition, this profile includes common format requirements for parameters accessible on the user interface level. (Vol 3, part C of Bluetooth Core Specification 4.0)

3.2.3
GATT
Generic ATTrIBUTE profile
Generic Attribute Profile describes a service framework using the Attribute Protocol for discovering services, and for reading and writing characteristic values on a peer device (Vol 3 part G of Bluetooth Core Specification 4.0).

4 Document conventions and organization

4.1 Conventions
In this document a number of terms, conditions, mechanisms, sequences, parameters, events, states, or similar terms are printed with the first letter of each word in uppercase and the rest lowercase (e.g., Network Architecture). Any lowercase uses of these words have the normal technical English meaning.

4.2 Notation
In this document, features are described as required, recommended, allowed or DEPRECATED as follows:

Required (or shall or mandatory).

These basic features shall be implemented to comply with the Mapping Specification. The phrases "shall not", and "PROHIBITED" indicate behavior that is prohibited, i.e. that if performed means the implementation is not in compliance.

Recommended (or should).

These features add functionality supported by the Mapping Specification and should be implemented. Recommended features take advantage of the capabilities the Mapping Specification, usually without imposing major increase of complexity. Notice that for compliance
testing, if a recommended feature is implemented, it shall meet the specified requirements to be in compliance with these guidelines. Some recommended features could become requirements in the future. The phrase "should not" indicates behavior that is permitted but not recommended.

Allowed (or allowed).

These features are neither required nor recommended by the Mapping Specification, but if the feature is implemented, it shall meet the specified requirements to be in compliance with these guidelines.

Conditionally allowed (CA)

The definition or behavior depends on a condition. If the specified condition is met, then the definition or behavior is allowed, otherwise it is not allowed.

Conditionally required (CR)

The definition or behavior depends on a condition. If the specified condition is met, then the definition or behavior is required. Otherwise the definition or behavior is allowed as default unless specifically defined as not allowed.

DEPRECATED

Although these features are still described in this document, they should not be implemented except for backward compatibility. The occurrence of a deprecated feature during operation of an implementation compliant with the current document has no effect on the implementation’s operation and does not produce any error conditions. Backward compatibility may require that a feature is implemented and functions as specified but it shall never be used by implementations compliant with this document.

Strings that are to be taken literally are enclosed in "double quotes".

Words that are emphasized are printed in italic.

5 Theory of Operation

5.1 Interworking Approach

The interworking between the BLE defined services/characteristics model and OCF defined Resources is modelled using the derived model syntax described in Derived Models for Interoperability between IoT Ecosystems.

5.2 Mapping Syntax

Within the defined syntax for derived modelling used by this document there are two blocks that define the actual Property-Property equivalence or mapping. These blocks are identified by the keywords "x-to-ocf" and "x-from-ocf". Derived Models for Interoperability between IoT Ecosystems does not define a rigid syntax for these blocks; they are free form string arrays that contain pseudo-coded mapping logic.

In this document, Python (version >= 3.0) syntax is used to describe translation rules.

The JSON skeleton shows typical translation block used in the derived models.

```
"<BLE Service Name>" : {
    "type": "object",
    "properties": {
        "<a value field in BLE Characteristic value>" : {
            "x-ocf-conversion" : {
                "x-ocf-alias": "<corresponding OCF Resource type>",
                "x-to-ocf": [ ... 
```
– <BLE Service Name>: this is fully qualified name of a BLE Service (e.g. "org.bluetooth.characteristic.blood_pressure_measurement")
– <a value field in BLE Characteristic value>: a Characteristic value is byte stream which is composed of multiple value fields. “A value field in BLE Characteristic value” is a description for one of them.
– <corresponding OCF Resource type>: an OCF Resource type which is corresponding to this BLE Service.
– “N/A”: in BLE Bridging, most of the BLE devices are read only. So there is no specific value to be written to the BLE devices from OCF Devices. Therefore, nothing is described in “x-from-ocf” translation clause. “N/A” is used to describe this case.

6 BLE Translation

6.1 Operational Scenarios

6.1.1 Introduction

The overall goal is to make Bridged BLE GATT Servers appear to OCF Clients as if they were native OCF Servers in the local network or cloud environment.

“Deep translation” between specific BLE Profile and OCF Device is specified in clause 9. Figure 1 shows an overview of the BLE Bridge Platform and its general topology. The BLE Bridging Function supports Asymmetric bridging. It exposes BLE GATT Servers to OCF Clients. Each Bridged BLE GATT Server shall be represented as a Virtual OCF Server.

Figure 1 – OCF-BLE Bridge Platform Components
6.1.2 Use case for BLE Bridging

Figure 2 shows a use case for an OCF Client and BLE GATT Server. An OCF Client on a smartphone reads a BLE thermometer device through an OCF-BLE Bridge Platform. Any connectivity that OCF supports is used for communications between the OCF Client and the OCF-BLE Bridge Platform. The OCF Client can communicate with OCF-BLE Bridge Platform through OCF Cloud.

![Diagram of BLE Bridging use case in real life](image)

6.2 Requirements specific to BLE Bridging Function

6.2.1 General

A BLE Bridging Function supports asymmetric bridging. It exposes BLE GATT server to OCF Clients only. Therefore, it shall play a BLE GATT client role. (This is a requirement so that users can expect that a certified OCF Bridge Platform will be able to talk to any BLE GATT server device, without the user having to buy some other device.).

6.2.2 Requirements specific to BLE

The version of Bluetooth SIG core specification that this document refers to is 4.0 or higher (see Bluetooth Core Specification 4.0). Bluetooth BR/EDR is not included in the scope of this document.

6.2.3 Exposing BLE GATT Servers to OCF Clients

6.2.3.1 General

The requirements in this clause apply when using algorithmic translation, and by default apply to deep translation unless the relevant requirements for such deep translation specifies otherwise.

Basic translation rule between BLE Service/Characteristic model and OCF Resource model is described in Table 1.

<table>
<thead>
<tr>
<th>From BLE</th>
<th>mapping count</th>
<th>To OCF</th>
<th>mapping count</th>
</tr>
</thead>
<tbody>
<tr>
<td>GATT-based profile</td>
<td>n</td>
<td>OCF Device</td>
<td>1</td>
</tr>
</tbody>
</table>
One or more BLE GATT-based profiles should be mapped to one Virtual OCF Server (e.g. Health Thermometer profile (HTP) is mapped to Body Thermometer Device ("oic.d.body.thermometer")). A BLE Service should be mapped to one or more OCF Resources (e.g. Health Thermometer Service is mapped to Temperature ("oic.r.body.temperature") and Body Location for temperature ("oic.r.body.location.temperature")). Each Characteristic of BLE Service should be mapped to one or more Properties of OCF Resource (if there is no BLE Characteristic corresponding to an OCF Property, default value should be used). Table 2 is a translation example of this rule. Figure 3 provides an illustration of this rule.

**Figure 3 – Translation mapping rule illustration**

**Table 2 – BLE to OCF translation example (Blood Pressure Device)**

<table>
<thead>
<tr>
<th>BLE Profile \ OCF Device</th>
<th>BLE Service \ OCF Resource</th>
<th>BLE Characteristic</th>
<th>OCF</th>
<th>OCF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Blood Pressure Profile (BLP)</td>
<td>Blood Pressure Measurement Service (&quot;org.bluetooth.service.blood_pressure&quot;)</td>
<td>Blood Pressure Measurement (&quot;org.bluetooth.characteristic.blood_pressure_measurement&quot;)</td>
<td>Blood Pressure Monitor Device (&quot;oic.d.bloodpressuremonitor&quot;)</td>
<td>Blood Pressure (&quot;oic.r.blood.pressure&quot;)</td>
</tr>
<tr>
<td>Blood Pressure Measurement Service (&quot;org.bluetooth.service.blood_pressure&quot;)</td>
<td>Device Information Service (&quot;org.bluetooth.service.device_information&quot;)</td>
<td></td>
<td>Pulse Rate (&quot;oic.r.pulserate&quot;)</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Device (&quot;oic.wk.d&quot;)</td>
<td>Platform (&quot;oic.wk.p&quot;)</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>&quot;oic.r.blood.pressure.systolic&quot;</td>
<td>&quot;oic.r.blood.pressure.diastolic&quot;</td>
</tr>
</tbody>
</table>
Figure 4 shows an example for 1:N mapping between BLE Characteristic and OCF Properties. In this case, multiple fields in “Blood Pressure Measurement Service” are mapped into the Properties of OCF Resources (“oic.r.pulserate”, “oic.r.blood.pressure”).

![Figure 4 – An example for 1:N mapping between BLE Characteristic and OCF Properties](image)

**6.2.3.2 Translation for well-defined set**

**6.2.3.2.1 General**

If a BLE Profile is in a well-defined set, translation should be done as follows. Table 3 is the list of BLE GATT-based Profiles which have corresponding OCF Resources as of now.

**Table 3 – BLE GATT-based Profile – OCF Resource mapping**

<table>
<thead>
<tr>
<th>BLE GATT-based Profile</th>
<th>BLE Service</th>
<th>OCF Resource</th>
<th>OCF Device Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Blood Pressure Profile</td>
<td>Blood Pressure Service</td>
<td>“oic.r.bloodpressuremonitor-am”</td>
<td>“oic.d.bloodpressuremonitor”</td>
</tr>
<tr>
<td></td>
<td></td>
<td>“oic.r.blood.pressure”</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>“oic.r.pulserate”</td>
<td></td>
</tr>
<tr>
<td>Device Information Service</td>

<td><em>oic.wk.d</em></td>
<td></td>
</tr>
<tr>
<td>Glucose Profile</td>
<td>Glucose Service</td>
<td>“oic.r.glucosemeter-am”</td>
<td>“oic.d.glucosemeter”</td>
</tr>
</tbody>
</table>
This clause describes how the URI for a Virtual OCF Resource is derived.

Case 1: a BLE Service is mapped to an OCF Resource:

- /<BLE Service name without prefix "org.bluetooth.service">, (e.g. BLE Service "Fitness Machine (org.bluetooth.service.fitness_machine)"; /fitness_machine)

Case 2: a BLE Service is mapped to multiple OCF Resources. If corresponding multiple OCF Resources are grouped by Collection (or Atomic Measurement Collection), URI should be as follows:

- URI for Collection Resource: /<BLE Service name without prefix "org.bluetooth.service"> (e.g. BLE Service "Health Thermometer (org.bluetooth.service.health_thermometer)"; /health_thermometer)
- URI for each OCF Resource link: /<OCF Resource Type value of corresponding linked Resource without prefix "oic.r"> (e.g. /temperature for "oic.r.temperature", /body.location.temperature for "oic.r.body.location.temperature")

If corresponding multiple OCF Resources are not grouped by Collection, URI should be as follows:

- URI for each OCF Resource: /<BLE Service name without prefix "org.bluetooth.service">/<OCF Resource Type value of corresponding Resource without prefix "oic.r">
### Table 4 – URI mapping example

<table>
<thead>
<tr>
<th>URI</th>
<th>BLE</th>
<th>OCF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Health Thermometer Service (&quot;org.bluetooth.service.health_thermometer&quot;)</td>
<td>/health_thermometer (for Atomic Collection Resource) /temperature (for &quot;oic.r.temperature&quot;) /body.location.temperature (for &quot;oic.r.body.location.temperature&quot;)</td>
<td></td>
</tr>
</tbody>
</table>

#### 6.2.3.2.3 Common Properties of Resource Type

#### 6.2.3.2.4 Platform Resource ("rt" of "oic.wk.p")

Platform ID ("pi", Mandatory): since BLE device does not provide a mandatory unique "name" (or id) which can be used to generate name-based UUID described in IETF RFC 4122 clause 4.3, randomly-generated UUID described in IETF RFC 4122 clause 4.4 should be used for Platform ID.

Manufacturer Name ("mnmn", Mandatory): if Device Information Service is implemented "manufacturer_name_string" Characteristic should be used, or "<device_name> by unknown" should be used as default value (<device_name> is a Characteristic of GAP).

#### 6.2.3.2.5 Device Resource ("rt" of "oic.wk.d")

Spec Version ("icv", Mandatory): Spec version of ISO/IEC 30118-1:2019 that the Bridging Function implements should be used.

Device ID ("di", Mandatory): as specified in ISO/IEC 30118-2:2019, the value of the "di" Property of OCF Devices (including Virtual OCF Devices) shall be established as part of On-boarding of that Virtual OCF Device.

Data Model Version ("dmv", Mandatory): spec version of the vertical specification this device data model is implemented to should be used. Syntax is "<vertical>.major.minor".

Protocol Independent ID ("piid", Mandatory): randomly-generated UUID described in IETF RFC 4122 clause 4.4 should be used for "piid".

#### 6.2.3.3 Exposing a BLE GATT Server as a Virtual OCF Server

Table 5 shows how OCF Device Properties as specified in ISO/IEC 30118-1:2019, should be derived, typically from fields specified in BLE Device Information Service (Spec Type: "org.bluetooth.service.device_information", Service ID: 0x180A) and Generic Access Service (Spec Type: "org.bluetooth.service.generic_access", Service ID: 0x1800).
<table>

</table>
object has a "language" field and a "value" field containing the manufacturer name in the indicated language.

| Model Number | "dmno" | Model number as designated by manufacturer. | N | Model Number String (Device Information) | This characteristic represents the model number that is assigned by the Device vendor. | N |

Regarding configuration resource ("oic.wk.con"), it is not created on the Virtual OCF Server since that information/interaction is not supported on BLE side.

Table 6 shows how platform Properties, as specified in ISO/IEC 30118-1:2019, are derived, typically from fields specified in BLE Device Information Service and Generic Access Service.

Table 6 – "oic.wk.p" Resource Type definition

<table>

<td></td>
</tr>
</tbody>
</table>

No BLE Service equivalence exist for factory reset or restart, so there is no Characteristics for "oic.wk.mnt" Properties "Factory_Reset" and "Reboot", so mapping for "oic.wk.mnt" is omitted.

6.2.3.4 On-the-fly Translation

If a BLE Profile is not in Table 3 (not belong to a well-defined set), a BLE Bridging Function does not translate it (on-the-fly translation is not supported).

6.2.3.5 Protocol translation between BLE and OCF

Adopted Bluetooth Profiles, Services, Protocols and Transports describes not only Service/Characteristic data model but also Features how to manipulate it. GATT Features define how GATT-based data exchanges takes place. The GATT features are used when we translate OCF CRUDN into BLE protocol and vice versa.

Table 8 shows translation rule between BLE GATT Feature and OCF CRUDN. When a BLE Bridging Function receives CREATE/DELETE request from OCF Client, it shall return corresponding error (i.e. 4.xx or 5.xx) because there are no corresponding Features for them. If a BLE Bridging Function receives RETRIEVE/UPDATE request from OCF Client, it shall translate it into Characteristic Value Read/Characteristic Value Write respectively. NOTIFY request from OCF Client shall be translated into Characteristic Descriptor Value Write, and Characteristic Value Notification/Indication from BLE GATT Server shall be translated into NOTIFICATION response.

Table 8 – Protocol translation rule between BLE and OCF

<table>
<thead>

6.2.3.6 Illustrative OCF to BLE translation flows

6.2.3.6.1 Initialization

Figure 5 shows the initial pairing procedure.
6.2.3.6.2 Resource Discovery

Figure 6 shows the resource discovery procedure.

6.2.3.6.3 Create Resource

Figure 7 illustrates Resource creation.

6.2.3.6.4 Retrieve Resource

Figure 8 illustrates Resource RETRIEVAL.
6.2.3.6.5 Update Resource

Figure 9 illustrates Resource UPDATE. Note that this only applies to Resources that were created.

6.2.3.6.6 Delete Resource

Figure 10 illustrates Resource DELETE. Note that this only applies to Resources that were created.
6.2.3.6.7 Set Notification & Send Notification

Figure 11 illustrates the establishment and sending of a notification.

6.2.3.7 Error handling

If a BLE operation fails, the Bridging Function sends an appropriate OCF error response to the OCF Client. It constructs an appropriate OCF error message (e.g., diagnostic payload if using CoAP) from the BLE error name and error code (if any), using the form "<error name>: <error message>", with the <error name> taken from the ATT error code field and the <error message> taken from the ATT error name, and the error code for the OCF network set to an appropriate value.

7 Device Type Mapping

7.1 Introduction

This clause contains the mappings to OCF Device Types.

7.2 BLE Profile to OCF Device Types

Table 9 captures the equivalency mapping between BLE Profile and OCF defined Device Types. The minimum Resource sets for each OCF Device is provided in ISO/IEC 30118-5:2019.

Table 9 – BLE Profile to OCF Device Type Mapping

<table>
<thead>
<tr>
<th>BLE GATT-based Profile</th>
<th>OCF Device Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Blood Pressure Profile</td>
<td>&quot;oic.d.bloodpressuremonitor&quot;</td>
</tr>
</tbody>
</table>
8 BLE Profile to Resource Equivalence

8.1 Introduction
This clause lists the complete set of applicable BLE Profiles and provides the equivalent OCF Resource Type(s) to which the BLE Profiles map.

8.2 BLE Services to OCF Resources
Table 10 captures the equivalency mapping between BLE Services and OCF defined Resource Types (see ISO/IEC 30118-4:2019). Detailed Property by Property mappings are provided in clause 9.

9 Detailed Mappings

9.1 Introduction
This clause provides an API and mapping description that aligns with the Derived Modelling syntax described in Derived Models for Interoperability between IoT Ecosystems for all services/characteristics and Resources that are within scope.

9.2 Blood Pressure Mapping

9.2.1 Derived model
The derived model: "org.bluetooth.characteristic.blood_pressure_measurement".

9.2.2 Property definition
Table 11 provides the detailed per Property mapping for "org.bluetooth.characteristic.blood_pressure_measurement".

Table 11 – The Property mapping for "org.bluetooth.characteristic.blood_pressure_measurement".

A.1 BLE GATT based data model & GATT features

A.1.1 Introduction
The Generic Attribute Profile (GATT) defines a service framework using the Attribute Protocol. This framework defines procedures and formats of services and their characteristics. The procedures defined include discovering, reading, writing, notifying and indicating characteristics, as well as configuring the broadcast of characteristics.

A.1.2 Profile dependency
Figure A-1 depicts the structure and the dependencies of the profiles. A profile is dependent upon another profile if it re-uses parts of that profile by implicitly or explicitly referencing it.

A.1.3 Configurations and roles
There are two roles defined in GATT profile:

- Client: This is the device that initiates commands and requests towards the server and can receive responses, indications and notifications sent by the server.
- Server: This is the device that accepts incoming commands and requests from the client and sends responses, indications and notifications to a client.

A device can act in both roles at the same time.

A.1.4 GATT profile hierarchy

A.1.4.1 Introduction
The GATT Profile specifies the structure in which profile data is exchanged. This structure defines basic elements such as services and characteristics, used in a profile. All of the elements are contained by Attributes. Attributes used in the ATT are containers that carry this profile data.

The top level of the hierarchy is a profile. A profile is composed of one or more services necessary to fulfil a use case. A service is composed of characteristics or references to other services. Each characteristic contains a value and may contain optional information about the value. The service
and characteristic and the components of the characteristic (i.e. value and descriptors) contain the
profile data and are all stored in Attributes on the server.

Under GATT profile, entity that provides Service-Characteristics data model plays “server” role
and entity that gets data from GATT server plays “client” role.

There are other application profiles based on GATT profile. They are called “GATT-based profiles”.

Figure A-2 Illustrates the GATT profile hierarchy.

**Figure A-2 – GATT profile hierarchy**

### A.1.4.2 Characteristic

A characteristic is a value used in a service along with properties and configuration information
about how the value is accessed and information about how the value is displayed or represented.
In GATT, a characteristic is defined by its characteristic definition. A characteristic definition
contains a characteristic declaration, characteristic properties, and a value and may contain
descriptors that describe the value or permit configuration of the server with respect to the
characteristic.

### A.1.4.3 GATT features

GATT profile also supports GATT features. GATT feature defines how GATT-based data
exchanges take place. Each feature is mapped to one or more sub-procedures. These sub-
procedures describe how the ATT is used to accomplish the corresponding feature, please see
Table A-1.

**Table A-1 – GATT Features and ATT protocol**

Supporting Atomic Measurement Operation in BLE

B.1 Atomic Measurement Resource Type in OCF

Most OCF healthcare devices adopt the Atomic Measurement feature. Atomic Measurement Resource Type is a specialisation of a Collection to ensure that the Client can only access the Properties of the linked Resources as a single group. Thus, if an OCF device corresponding to a BLE device implements Atomic Measurement Resource Type, the BLE Bridging Function should guarantee that BLE GATT Characteristic values corresponding to properties of the Atomic Measurement Resource Type can be retrieved in atomic way.

B.2 Case 1. One Characteristic covers all properties of an Atomic Measurement Resource Type

In OCF-BLE mapping, a Service can be mapped to multiple OCF Resources and “a Characteristic” in a Service can be mapped to Properties in multiple OCF Resources. In general, “Value of a Characteristic” is a byte stream (see Figure B-1, byte stream is a value of “blood pressure measurement Characteristic”). Usually “value of a Characteristic” includes multiple fields like below example and each field can be mapped to a property of OCF Resource.

<table>
<thead>
<tr>
<th>Measurement Status</th>
<th>UserID</th>
<th>Pulse Rate</th>
<th>Time Stamp</th>
<th>Blood Pressure Measurement Compound Value - Mean Arterial Pressure</th>
<th>Blood Pressure Measurement Compound Value - Diastolic</th>
<th>Blood Pressure Measurement Compound Value - Systolic</th>
<th>Flags</th>
</tr>
</thead>

<td>2bytes</td>
<td>2bytes</td>
<td>2bytes</td>
<td>1byte</td>
</tr>
</tbody>
</table>

**Figure B-1 – Value of blood pressure measurement Characteristic**

For blood pressure device, “blood pressure measurement Characteristic” can cover all properties in bloodpressuremonitor-am. So if BLE GATT client (OCF-BLE Bridge Platform) uses “Read Characteristic Value” operation, it can get all values corresponding to all properties in bloodpressuremonitor-am at one time (atomic operation); see Figure B-2 for an example flow.

B.3 Case 2. Multiple Characteristics cover all properties of an Atomic Measurement Resource Type

For glucose meter, 2 Characteristics (glucose measurement Characteristic, glucose measurement context Characteristic) cover all properties in glucose meter - am. In this case, a BLE GATT client (OCF - BLE Bridge Platform) can use “Read Multiple Characteristic Values” operation to get multiple Characteristic values at one time; please see Figure B-3 for an example flow.

However, some BLE GATT server may not support all operations except for “Notification”. In this case, a Characteristic value includes “sequence number” field, so BLE GATT client (OCF - BLE Bridge Platform) can make a set of values which are measured at the same time by using it.

Figure B-4 and Figure B-5 are two Characteristics of glucose Service.
