Introduction

This document, and all the other parts associated with this document, were developed in response to worldwide demand for smart home focused Internet of Things (IoT) devices, such as appliances, door locks, security cameras, sensors, and actuators; these to be modelled and securely controlled, locally and remotely, over an IP network.

While some inter-device communication existed, no universal language had been developed for the IoT. Device makers instead had to choose between disparate frameworks, limiting their market share, or developing across multiple ecosystems, increasing their costs. The burden then falls on end users to determine whether the products they want are compatible with the ecosystem they bought into, or find ways to integrate their devices into their network, and try to solve interoperability issues on their own.

In addition to the smart home, IoT deployments in commercial environments are hampered by a lack of security. This issue can be avoided by having a secure IoT communication framework, which this standard solves.

The goal of these documents is then to connect the next 25 billion devices for the IoT, providing secure and reliable device discovery and connectivity across multiple OSs and platforms. There are multiple proposals and forums driving different approaches, but no single solution addresses the majority of key requirements. This document and the associated parts enable industry consolidation around a common, secure, interoperable approach.

The OCF specification suite is made up of nineteen discrete documents, the documents fall into logical groupings as described herein:

- Core framework
  - Core Specification
  - Security Specification
  - Onboarding Tool Specification
- Bridging framework and bridges
  - Bridging Specification
  - Resource to Alljoyn Interface Mapping Specification
  - OCF Resource to oneM2M Resource Mapping Specification
  - OCF Resource to BLE Mapping Specification
  - OCF Resource to EnOcean Mapping Specification
  - OCF Resource to LWM2M Mapping Specification
  - OCF Resource to UPlus Mapping Specification
  - OCF Resource to Zigbee Cluster Mapping Specification
- Resource and Device models
  - Resource Type Specification
  - Device Specification
- Core framework extensions
  - Easy Setup Specification
  - Core Optional Specification
- OCF Cloud
– Cloud API for Cloud Services Specification
– Device to Cloud Services Specification
– Cloud Security Specification
OCF Resource to oneM2M Resource Mapping Specification

1 Scope

This document provides detailed mapping information to provide equivalency between oneM2M defined Module Classes and OCF defined Resources.

A oneM2M Bridge is Asymmetric Client Bridge, therefore this document provides unidirectional mapping for Device Types (oneM2M Devices to OCF Devices), identifies equivalent OCF Resources for specific oneM2M Module Classes, and defines the detailed Property by Property mapping using OCF defined extensions to JSON schema to programatically define the mappings.

2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

Derived Models for Interoperability between IoT Ecosystems, Stevens & Merriam, March 2016

3 Terms and definitions

3.1 Terms and definitions

For the purposes of this document, the terms and definitions given in ISO/IEC 30118-1, ISO/IEC 30118-2, and ISO/IEC 30118-3 and the following apply.
ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at https://www.iso.org/obp

3.1.1 oneM2M Application
the oneM2M control point (i.e. client) being mapped to a Virtual OCF Client.

4 Document conventions and organization

4.1 Conventions
In this document a number of terms, conditions, mechanisms, sequences, parameters, events, states, or similar terms are printed with the first letter of each word in uppercase and the rest lowercase (e.g., Network Architecture). Any lowercase uses of these words have the normal technical English meaning.

In this document, to be consistent with the IETF usages for RESTful operations, the RESTful operation words CRUDN, CREATE, RETRIEVE, UPDATE, DELETE, and NOTIFY will have all letters capitalized. Any lowercase uses of these words have the normal technical English meaning.

4.2 Notation
In this document, features are described as required, recommended, allowed or DEPRECATED as follows:

Required (or shall or mandatory).

- These basic features shall be implemented to comply with OIC Core Architecture. The phrases "shall not", and "PROHIBITED" indicate behaviour that is prohibited, i.e. that if performed means the implementation is not in compliance.

Recommended (or should).

- These features add functionality supported by OIC Core Architecture and should be implemented. Recommended features take advantage of the capabilities OIC Core Architecture, usually without imposing major increase of complexity. Notice that for compliance testing, if a recommended feature is implemented, it shall meet the specified requirements to be in compliance with these guidelines. Some recommended features could become requirements in the future. The phrase "should not" indicates behaviour that is permitted but not recommended.

Allowed (or allowed).

- These features are neither required nor recommended by OIC Core Architecture, but if the feature is implemented, it shall meet the specified requirements to be in compliance with these guidelines.

- Conditionally allowed (CA) The definition or behaviour depends on a condition. If the specified condition is met, then the definition or behaviour is allowed, otherwise it is not allowed.

Conditionally required (CR)

- The definition or behaviour depends on a condition. If the specified condition is met, then the definition or behaviour is required. Otherwise the definition or behaviour is allowed as default unless specifically defined as not allowed.

DEPRECATED
Although these features are still described in this document, they should not be implemented except for backward compatibility. The occurrence of a deprecated feature during operation of an implementation compliant with the current document has no effect on the implementation's operation and does not produce any error conditions. Backward compatibility may require that a feature is implemented and functions as specified but it shall never be used by implementations compliant with this document.

Strings that are to be taken literally are enclosed in "double quotes".

Words that are emphasized are printed in italic.

5 Theory of operation

5.1 Interworking approach

The interworking between oneM2M defined Module Classes and OCF defined Resource Types is modelled using the derived model syntax described in Derived Models for Interoperability.

5.2 Mapping syntax

5.2.1 Introduction

Within the defined syntax for derived modelling used by this document there are two blocks that define the actual Property-Property equivalence or mapping. These blocks are identified by the keywords "x-to-ocf" and "x-from-ocf". Derived Models for Interoperability does not define a rigid syntax for these blocks; they are free form string arrays that contain pseudo-coded mapping logic.

Within this document we apply the rules defined in clause 5.2 to these blocks to ensure consistency and re-usability and extensibility of the mapping logic that is defined.

5.2.2 General

All statements are terminated with a carriage return.

5.2.3 Value assignment

The equals sign (=) is used to assign one value to another. The assignee is on the left of the operator; the value being assigned on the right.

5.2.4 Property naming

All Property names are identical to the name used by the original model; for example, from the OCF Temperature Resource the Property name "temperature" is used whereas when referred to the derived ecosystem then the semantically equivalent Property name is used.

5.2.5 Arrays

An array element is indicated by the use of square brackets "[]" with the index of the element contained therein, e.g. range[1]. All arrays start at an index of 0. If an entire array is being referenced, then no index is included.

5.2.6 Conditional mapping

When a mapping is dependent on the meeting of other conditions then the syntax:

if "condition", "mapping".

is applied.
6 oneM2M translation

6.1 Operational scenarios
The purpose of the oneM2M Bridge Platform is to enable access by the oneM2M ecosystem to select OCF Servers. This is accomplished by creating Virtual OCF Clients to represent the necessary access levels to the OCF servers that are exposed to the oneM2M ecosystem. The oneM2M Bridge Platform then exposes native oneM2M entities that map to those Virtual OCF Clients.

The oneM2M Bridge Platform is an Asymmetric Client Bridge.

The mapping between the OCF data models and the oneM2M data models is specified in 9. Programmatic (i.e. On-the-fly) data model translation is not supported.

6.2 Enabling oneM2M application access to OCF servers
Each level of oneM2M application access for OCF servers is modelled as a Virtual OCF Client. In this way, oneM2M application access can be appropriately restricted and enforced by the OCF security capabilities.

6.3 Enabling OCF client access to oneM2M devices
This capability is not supported.

6.4 On-the-fly translation
All devices and resources have been aligned between the OCF and oneM2M ecosystems, so on-the-fly translation is not required.

If new OCF devices are not reflected into the oneM2M ecosystem by updates to the oneM2M specifications, the Bridge Platform will not provide a successful translation of those devices.

7 Device type mapping

7.1 Introduction
This clause contains the mappings to/from Device Types.

7.2 OneM2M device types to OCF device types
Table 1 captures the equivalency mapping between oneM2M defined Device Types and OCF defined Device Types. The minimum Resource sets for each OCF Device is provided in ISO/IEC 30118-5.

8 Resource to oneM2M module class equivalence

8.1 Introduction
This clause lists the complete set of applicable oneM2M Module Classes and provides the equivalent OCF Resource Type(s) to which the Module Classes map.

8.2 OneM2M module classes to OCF resources
Table 2 captures the equivalency mapping between oneM2M defined Module Classes and OCF defined Resource Types (see ISO/IEC 30118-4). Detailed Property by Property mappings are provided in clause 9.

9 Detailed mapping APIs

9.1 Introduction
This clause provides an API and mapping description that aligns with the Derived Modelling syntax described in Derived Models for Interoperability for all Module Classes and Resources that are within scope.

The derived model definitions presented in clause 9 are formatted for readability, and so may appear to have extra line breaks.

9.2 3D printer
9.2.1 Derived model
The derived model: "onem2m.m.3Dprinter".

9.2.2 Property definition
Table 3 provides the detailed per Property mapping for "onem2m.m.3Dprinter".

<table>
<thead>
<tr>
<th>oneM2M Property name</th>
<th>OCF Resource</th>
<th>To OCF</th>
<th>From OCF</th>
</tr>
</thead>
<tbody>

The desired duration of 'keep water warm' function. It indicates how long water shall be kept warm e.g. after the boiling in the case of a kettle. The value indicates a time expressed in minutes.

9.34.3 Derived model definition

9.49 Steam closet job mode

9.49.1 Derived model
The derived model: "onem2m.m.steamclosetjobmode".

9.49.2 Property definition
Table 97 provides the detailed per Property mapping for "onem2m.m.steamclosetjobmode".

Table 97 – The property mapping for "onem2m.m.steamclosetjobmode".

<table>
<thead>
<tr>
<th>oneM2M Property name</th>
<th>OCF Resource</th>
<th>To OCF</th>
<th>From OCF</th>
</tr>
</thead>
<tbody>
<tr>
<td>currentJobMode</td>
<td>oic.r.operational.state</td>
<td>Need to translate between the oneM2M integer value and the OCF operational state enumerated stringif ( currentJobMode == 1 ) { oic.r.operational.state.currentJobState == &quot;aroma&quot; }; }if ( currentJobMode == 2 ) { oic.r.operational.state.currentJobState == &quot;steam&quot; }; }if ( currentJobMode == 3 ) { oic.r.operational.state.currentJobState == &quot;pure&quot; }; }if ( currentJobMode == 4 ) { oic.r.operational.state.currentJobState == &quot;zigzag&quot;; }</td>
<td>Need to translate between the OCF operational state enumerated string and the oneM2M integer valueif (oic.r.operational.state.currentJobState == &quot;aroma&quot;) { currentJobMode = 1; }if (oic.r.operational.state.currentJobState == &quot;steam&quot;) { currentJobMode = 2; }if (oic.r.operational.state.currentJobState == &quot;pure&quot;) { currentJobMode = 3; }if (oic.r.operational.state.currentJobState == &quot;zigzag&quot;) { currentJobMode = 4; }</td>
</tr>
</tbody>
</table>
This does not exist in OCF as all possible operational states are available.

This is an array of integers in oneM2M defined by the current version of the specification as follows:

<table>
<thead>
<tr>
<th>jobModes</th>
<th>oic.r.operation.al.state</th>
</tr>
</thead>
<tbody>
<tr>
<td>jobModes[1] = 1</td>
<td></td>
</tr>
<tr>
<td>jobModes[2] = 2</td>
<td></td>
</tr>
<tr>
<td>jobModes[3] = 3</td>
<td></td>
</tr>
<tr>
<td>jobModes[4] = 4</td>
<td></td>
</tr>
</tbody>
</table>

This value does not exist in OCF as it is already accommodated in the currentJobMode property.

Need to translate between the OCF operational state enumerated string and the oneM2M string value if:

| currentJobModeName = "reduceOdor"; |
| currentJobModeName = "steamWrinkle"; |
| currentJobModeName = "helpClean"; |
| currentJobModeName = "gentleDry"; |

Table 98 provides the details of the Properties that are part of "onem2m.m.steamclosetjobmode".

9.53 Weight

9.53.1 Derived model

The derived model: "onem2m.m.weight".

9.53.2 Property definition

Table 105 provides the detailed per Property mapping for "onem2m.m.weight".

<table>
<thead>
<tr>
<th>oneM2M name</th>
<th>Property</th>
<th>OCF Resource</th>
<th>To OCF</th>
<th>From OCF</th>
</tr>
</thead>
<tbody>
<tr>
<td>weight</td>
<td></td>
<td>oic.r.weight</td>
<td>oic.r.weight.weight = weight</td>
<td>oneOf</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>oic.r.weight.units = kg</td>
<td></td>
</tr>
</tbody>
</table>

Table 106 provides the details of the Properties that are part of "onem2m.m.weight".

<table>
<thead>
<tr>
<th>oneM2M name</th>
<th>Property</th>
<th>Type</th>
<th>Required</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
