1 Scope

This document defines security objectives, philosophy, resources and mechanism that impacts OCF base layers of ISO/IEC 30118-1:2018. ISO/IEC 30118-1:2018 contains informative security content. The OCF Security Specification contains security normative content and may contain informative content related to the OCF base or other OCF documents.

2 Normative References

The following documents, in whole or in part, are normatively referenced in this document and are indispensable for its application. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

3 Terms, definitions, and abbreviated terms

3.1 Terms and definitions

For the purposes of this document, the terms and definitions given in ISO/IEC 30118-1:2018 and the following apply.

ISO and IEC maintain terminological databases for use in standardization at the following addresses:

– ISO Online browsing platform: available at https://www.iso.org/obp

3.1.1 Access Management Service (AMS)
dynamically constructs ACL Resources in response to a Device Resource request.

Note 1 to entry: An AMS can evaluate access policies remotely and supply the result to a Server which allows or denies a pending access request. An AMS is authorised to provision ACL Resources.

3.1.2 Access Token – moved to OCF Cloud Security Specification

3.1.3 Authorization Provider – moved to OCF Cloud Security Specification

3.1.4 Client

Note 1 to entry: The details are defined in ISO/IEC 30118-1:2018.

3.1.5 Credential Management Service (CMS)
a name and Resource Type ("oic.sec.cms") given to a Device that is authorized to provision credential Resources.

3.1.6 Device

Note 1 to entry: The details are defined in ISO/IEC 30118-1:2018.

3.1.7 Device Class

Note 1 to entry: As defined in IETF RFC 7228. IETF RFC 7228 defines classes of constrained devices that distinguish when the OCF small footprint stack is used vs. a large footprint stack. Class 2 and below is for small footprint stacks.

3.1.8 Device UUID

a stack instance identifier.

3.1.9 Device Ownership Transfer Service (DOTS)
a logical entity that establishes device ownership

3.1.10 Device Registration – moved to OCF Cloud Security Specification

3.1.11 End-Entity

any certificate holder which is not a Root or Intermediate Certificate Authority.

Note 1 to entry: Typically, a device certificate.

3.1.12 Entity

Note 1 to entry: The details are defined in ISO/IEC 30118-1:2018.
3.1.13 OCF Interface

Note 1 to entry: The details are defined in ISO/IEC 30118-1:2018.

3.1.14 Intermediary

a Device that implements both Client and Server roles and may perform protocol translation, virtual device to physical device mapping or Resource translation.

3.1.15 OCF Cipher Suite

a set of algorithms and parameters that define the cryptographic functionality of a Device. The OCF Cipher Suite includes the definition of the public key group operations, signatures, and specific hashing and encoding used to support the public key.

3.1.16 OCF Cloud User – moved to OCF Cloud Security Specification

3.1.17 OCF Rooted Certificate Chain

a collection of X.509 v3 certificates in which each certificate chains to a trust anchor certificate which has been issued by a certificate authority under the direction, authority, and approval of the Open Connectivity Foundation Board of Directors as a trusted root for the OCF ecosystem.

3.1.18 Onboarding Tool (OBT)

a tool that implements DOTS(3.1.9), AMS(3.1.1) and CMS(3.1.5) functionality

3.1.19 Out of Band Communication Channel

any mechanism for delivery of a secret from one party to another, not specified by OCF

3.1.20 Owner Credential (OC)

a credential, provisioned to a Device, for the purposes of mutual authentication of the Device and OBT(3.1.18) during subsequent interactions, identified by having a Subject UUID matching the Resource Owner Id of the Device Ownership Transfer Resource hosted by a Device that has the credential

3.1.21 Platform ID

Note 1 to entry: The details are defined in ISO/IEC 30118-1:2018.

3.1.22 Property

Note 1 to entry: The details are defined in ISO/IEC 30118-1:2018.

3.1.23 Resource

Note 1 to entry: The details are defined in ISO/IEC 30118-1:2018.

3.1.24 Role (Network context)

stereotyped behavior of a Device; one of [Client, Server or Intermediary]
3.1.25
Role Identifier
a Property of an OCF credentials Resource or element in a role certificate that identifies a privileged role that a Server Device associates with a Client Device for the purposes of making authorization decisions when the Client Device requests access to Device Resources.

3.1.26
Secure Resource Manager (SRM)
a module in the OCF Core that implements security functionality that includes management of security Resources such as ACLs, credentials and Device owner transfer state.

3.1.27
Security Virtual Resource (SVR)
a resource supporting security features.

Note 1 to entry: For a list of all the SVRs please see clause 13.

3.1.28
Server
Note 1 to entry: The details are defined in ISO/IEC 30118-1:2018.

3.1.29
Trust Anchor
a well-defined, shared authority, within a trust hierarchy, by which two cryptographic entities (e.g. a Device and an OBT(3.1.18)) can assume trust

3.1.30
Device Configuration Resource (DCR)
a Resource that is any of the following:

a) a Discovery Core Resource, or
b) a Security Virtual Resource, or
c) a Wi-Fi Easy Setup Resource ("oic.r.easysetup", "oic.r.wificonf", "oic.r.devconf"), or
d) a CoAP Cloud Configuration Resource ("oic.r.coapcloudconf"), or
e) a Software Update Resource ("oic.r.softwareupdate"), or
f) a Maintenance Resource ("oic.wk.mnt").

3.1.31
Non-Configuration Resource (NCR)
a Resource that is not a Device Configuration Resource (3.1.30).

3.1.32
Bridged Device
Note 1 to entry: The details are defined in ISO/IEC 30118-3:2018.

3.1.33
Bridged Protocol
Note 1 to entry: The details are defined in ISO/IEC 30118-3:2018.

3.1.34
Bridge
Note 1 to entry: The details are defined in ISO/IEC 30118-3:2018.

3.1.35
Bridging Platform
Note 1 to entry: The details are defined in ISO/IEC 30118-3:2018.
3.1.36 Virtual Bridged Device
Note 1 to entry: The details are defined in ISO/IEC 30118-3:2018.

3.1.37 Virtual OCF Device
Note 1 to entry: The details are defined in ISO/IEC 30118-3:2018.

3.1.38 OCF Security Domain
set of onboarded OCF Devices that are provisioned with credentialing information for confidential communication with one another

3.1.39 Owned (or "in Owned State")
having the "owned" Property of the "/oic/sec/doxm" resource equal to "TRUE"

3.1.40 Unowned (or "in Unowned State")
having the "owned" Property of the "/oic/sec/doxm" resource equal to "FALSE"

3.1.41 OCF Onboarding
initial establishment of ownership over a Device, and initial provisioning of the Device for normal operation

3.1.42 Auditable Event
system activity that may be indicative of a violation of security policy

3.1.43 Auditable Event Entry
record of the details of an Auditable Event

3.1.44 End User
person using the [particular] product

3.2 Abbreviated terms

3.2.1 AC
Access Control

3.2.2 ACE
Access Control Entry

3.2.3 ACL
Access Control List

3.2.4 AES
Advanced Encryption Standard
Note 1 to entry: See NIST FIPS 197, "Advanced Encryption Standard (AES)"
3.2.5 AMS
Access Management Service

3.2.6 CMS
Credential Management Service

3.2.7 CRUDN
CREATE, RETREIVE, UPDATE, DELETE, NOTIFY

3.2.8 CSR
Certificate Signing Request

3.2.9 CVC
Code Verification Certificate

3.2.10 ECC
Elliptic Curve Cryptography

3.2.11 ECDSA
Elliptic Curve Digital Signature Algorithm

3.2.12 EKU
Extended Key Usage

3.2.13 DOTS
Device Ownership Transfer Service

3.2.14 ID
Identity/Identifier

3.2.15 JSON
JavaScript Object Notation.

3.2.16 JWS
JSON Web Signature.

Note 1 to entry: See IETF RFC 7515, "JSON Web Signature (JWS)"

3.2.17 KDF
Key Derivation Function

3.2.18 MAC
Message Authentication Code
3.2.19  MITM  Man-in-the-Middle
3.2.20  NVRAM  Non-Volatile Random-Access Memory
3.2.21  OC  Owner Credential
3.2.22  OCSP  Online Certificate Status Protocol
3.2.23  OBT  Onboarding Tool
3.2.24  OID  Object Identifier
3.2.25  OTM  Owner Transfer Method
3.2.26  OWASP  Open Web Application Security Project.
Note 1 to entry:  See https://www.owasp.org/
3.2.27  PE  Policy Engine
3.2.28  PIN  Personal Identification Number
3.2.29  PPSK  PIN-authenticated pre-shared key
3.2.30  PRF  Pseudo Random Function
3.2.31  PSI  Persistent Storage Interface
3.2.32  PSK  Pre Shared Key
3.2.33 RBAC
Role Based Access Control

3.2.34 RM
Resource Manager

3.2.35 RNG
Random Number Generator

3.2.36 SBAC
Subject Based Access Control

3.2.37 SEE
Secure Execution Environment

3.2.38 SRM
Secure Resource Manager

3.2.39 SVR
Security Virtual Resource

3.2.40 SW
Software

3.2.41 URI
Uniform Resource Identifier

3.2.43 VOD
Virtual OCF Device

3.2.44 RFNOP
Ready for Normal Operation

3.2.45 RFOTM
Ready for OTM

3.2.46 RFPRO
Ready for Provisioning
4 Document Conventions and Organization

4.1 Conventions

This document defines Resources, protocols and conventions used to implement security for OCF core framework and applications.

For the purposes of this document, the terms and definitions given in ISO/IEC 30118-1:2018 apply.

Figure 1 depicts interaction between OCF Devices.

![Figure 1 – OCF Interaction](image)

Devices may implement a Client role that performs Actions on Servers. Actions access Resources managed by Servers. The OCF stack enforces access policies on Resources. End-to-end Device interaction can be protected using session protection protocol (e.g. DTLS) or with data encryption methods.

4.2 Notation

In this document, features are described as required, recommended, allowed or DEPRECATED as follows:

**Required** (or **shall** or **mandatory**).

These basic features shall be implemented to comply with OCF Core Architecture. The phrases "shall not", and "PROHIBITED" indicate behaviour that is prohibited, i.e. that if performed means the implementation is not in compliance.

**Recommended** (or **should**).

These features add functionality supported by OCF Core Architecture and should be implemented. Recommended features take advantage of the capabilities OCF Core Architecture, usually without imposing major increase of complexity. Notice that for compliance testing, if a recommended feature is implemented, it shall meet the specified requirements to be in compliance with these guidelines. Some recommended features could become requirements in the future. The phrase "should not" indicates behaviour that is permitted but not recommended.

**Allowed** (may or allowed).

Copyright Open Connectivity Foundation, Inc. © 2016-2020. All rights Reserved
These features are neither required nor recommended by OCF Core Architecture, but if the feature is implemented, it shall meet the specified requirements to be in compliance with these guidelines.

**Conditionally allowed (CA)**

The definition or behaviour depends on a condition. If the specified condition is met, then the definition or behaviour is allowed, otherwise it is not allowed.

**Conditionally required (CR)**

The definition or behaviour depends on a condition. If the specified condition is met, then the definition or behaviour is required. Otherwise the definition or behaviour is allowed as default unless specifically defined as not allowed.

**DEPRECATED**

Although these features are still described in this document, they should not be implemented except for backward compatibility. The occurrence of a deprecated feature during operation of an implementation compliant with the current document has no effect on the implementation’s operation and does not produce any error conditions. Backward compatibility may require that a feature is implemented and functions as specified but it shall never be used by implementations compliant with this document.

Strings that are to be taken literally are enclosed in "double quotes".

Words that are emphasized are printed in italic.

**4.3 Data types**

**4.4 Document structure**

Informative clauses may be found in the Overview clauses, while normative clauses fall outside of those clauses.

The Security Specification may use the OpenAPI specification as the API definition language. The mapping of the CRUDN actions is specified in ISO/IEC 30118-1:2018.
5 Security Overview

5.1 Preamble

The goal of OCF's security architecture is to protect the data and device states represented by the OCF Resources. From the OCF perspective, a Device is a certifiable logical entity that participates in an OCF ecosystem. During interactions between Devices, the Device acting as the Server holds and controls the Resources and provides the Device acting as a Client access to those Resources, subject to a set of security mechanisms and conforming to the policies configured by the OCF Security Domain Owner. The Platform hosting the Device may provide security hardening to ensure robustness of the variety of operations described in this document. Multiple Devices may be hosted by the same Platform.

The security model is depicted in Figure 2 and described in the following steps:

1) The Client establishes a network connection to the Server (Device holding the Resources).
2) The Devices (Server and Client) exchange messages either via a mutually-authenticated secure channel between the two Devices or via an unsecure connection.
   a) The "/oic/sec/cred" Resource on each Device holds the credentials used for mutual authentication and credentials used for role authorization.
   b) Messages received over a secured channel are associated with a "deviceUUID". In the case of a certificate credential, the "deviceUUID" is part of the certificate received from the other Device. In the case of a symmetric key credential, the "deviceUUID" is associated with the credential in the "/oic/sec/cred" Resource.
   c) The Client may present its role certificate to request association with a role identifier ("roleid"). The Server may associate the Client with any number of role identifiers.
   d) Requests received by a Server over an unsecured channel are treated as anonymous and are not associated with any "deviceUUID" or "roleid".
3) The Client submits a request to the Server.

4) The Server receives the request.

   a) If the request is received over an unsecured channel, the Server treats the request as
      anonymous and no "deviceUUID" or "roleid" are associated with the request.

   b) If the request is received over a secured channel, then the Server associates the request
      with the "deviceUUID" of the Client and all valid "roleid" values of the Client by default.

   c) The Server then consults the Access Control List (ACL), and looks for an Access Control
      Entry (ACE) matching the following criteria:

      i) The requested Resource matches a Resource reference in the ACE

      ii) The requested operation is permitted by the "permissions" of the ACE, and

      iii) The "subjectUUID" contains either one of a special set of wildcard values or, if the
           Device is not anonymous, the subject matches the Client "deviceUUID" associated with
           the request or a valid "roleid" associated with the request. The special wildcard values
           authorize all Devices communicating over either authenticated and encrypted sessions
           or unsecured sessions to interact according to the ACE.

      If there is a matching ACE, then access to the Resource is permitted; otherwise access
      is denied. Access is enforced by the Server's Secure Resource Manager (SRM).

5) The Server sends a response back to the Client.

Resource protection includes protection of data both while at rest and during transit. Aside from
access control mechanisms, the OCF Security Specification does not include specification of
secure storage of Resources. Secure storage may be accomplished through the use of hardware
security or encryption of data at rest. The exact implementation of secure storage is subject to a
set of hardening requirements that are specified in clause 14 and may be subject to certification
guidelines.

Data in transit protection is specified fully as a normative part of this document. This document
only supports in transit data protection at the transport layer through use of mechanisms such as
DTLS.

NOTE: DTLS will provide packet by packet protection, rather than protection for the payload as whole. For instance, if
the integrity of the entire payload as a whole is required, separate signature mechanisms must have already been in
place before passing the packet down to the transport layer.

Figure 3 depicts OCF Security Enforcement Points.
5.2 Access Control

5.2.1 Access Control General

The OCF framework assumes that Resources are hosted by a Server and are made available to Clients subject to access control and authorization mechanisms. The Resources at the Server are protected through implementation of access control, authentication and confidentiality protection. This clause provides an overview of access control through the use of Access Control Lists. However, access control in OCF is agnostic regarding transport and connectivity abstraction layers. Implementation of access control relies on a-priori definition of a set of access policies for the Resource. The policies are stored locally in an ACL Resource provisioned by an Access Management Service (AMS) in the form of Access Control Entries (ACE). The lack of such an associated ACE results in the Resource being inaccessible. Multiple types of access control mechanisms may be applied:

- Subject-based access control (SBAC), where the ACE matches the identity of the Client against the subject included in the policy defined for the Resource. Asserting the identity of the Client requires an authentication process.
- Role-based Access Control (RBAC), where the ACE matches a role identifier included in the policy for the Resource to a role identifier associated with the Client.
- Wildcard-based Access Control, where the ACE matches a connection type, used to access the Resource (i.e. any mutually-authenticated connection).

The ACE only applies if the ACE matches both the subject (i.e. Client) and the requested Resource. There are multiple ways a subject could be matched, (1) Device UUID, (2) Role Identifier or (3) wildcard. The way in which the Client connects to the Server may be relevant for making access

---

Figure 3 – OCF Security Enforcement Points
control decisions. Wildcard matching on authenticated vs. unauthenticated and encrypted vs.
unencrypted connection allows an access policy to be broadly applied to subject classes.

Example Wildcard Matching Policy:

```
"aclist2": [
  {
    "subject": {"conntype": "anon-clear" },
    "resources": [{ "wc":"*" }
  },
  {"subject": {"conntype": "auth-crypt" },
    "resources": [{ "wc":"*" }
  }],
  "permission": 31
],
```

Details of the format for ACL are defined in clause 12. The ACL is composed of one or more ACEs.

Some Resources, such as Collections, generate requests to linked Resources when appropriate
Interfaces are used. In such cases, additional access control considerations are necessary.
Additional access control considerations for Collections when using the batch OCF Interface are
found in clause 12.2.7.3. ACL Resource requires the same security protection as other sensitive
Resources when it comes to both storage and handling by the SRM.

5.2.2 ACL Architecture

The Server examines the Resource(s) requested by the client before processing the request. The
access control resource is searched to find one or more ACE entries that match the Client and the
requested Resources. If a match is found, then permission and period constraints are applied. If
more than one match is found, then each ACE entry is evaluated for a match independently.

The Server uses the connection context to determine whether the subject has authenticated or not
and whether data confidentiality has been applied or not. If the user has authenticated, then subject
matching may happen at increased granularity based on role or device identity.

Each ACE contains the permission set that will be applied for a given Client. Permissions consist
of a combination of CREATE, RETRIEVE, UPDATE, DELETE and NOTIFY (CRUDN) actions.
Clients authenticate as a Device and optionally operating with one or more roles. Devices may
acquire elevated access permissions when asserting a role. For example, an "oic.role.owner" role
might expose additional Resources and OCF Interfaces not normally accessible.

Servers host ACL Resources locally. Local ACLs allow greater autonomy in access control
processing.

The following use cases describe the operation of access control:

Use Case 1: As depicted in Figure 4, Server Device hosts 4 Resources (R1, R2, R3 and R4). Client
Device D1 requests access to Resource R1 hosted at Server Device 5. ACL[0] corresponds to
Resource R1 and includes D1 as an authorized subject. Thus, Device D1 receives access to
Resource R1 because the local ACL "/oic/sec/acl2/0" matches the request.
5.3 Onboarding Overview

5.3.1 Onboarding General

Before a Device becomes operational in an OCF environment and is able to interact with other Devices, it needs to be appropriately onboarded. The first step in onboarding a Device is to configure the ownership where the legitimate user that owns/purchases the Device uses an Onboarding tool (OBT) and using the OBT uses one of the Owner Transfer Methods (OTMs) to establish ownership. Once ownership is established, the OBT provisions the Device, at the end of which the Device becomes operational and is able to interact with other Devices in an OCF environment.

Figure 5 depicts an overview of Onboarding.
Figure 5 – Onboarding overview

This clause explains the onboarding and security provisioning process but leaves the provisioning of non-security aspects to other OCF documents. In the context of security, all Devices are required to be provisioned with minimal security configuration that allows the Device to securely interact/communicate with other Devices in an OCF environment. This minimal security
configuration is defined as the Onboarded Device "Ready for Normal Operation" and is specified in 7.5.

5.3.2 Onboarding Steps

The flowchart in Figure 6 shows the typical steps that are involved during onboarding. Although onboarding may include a variety of non-security related steps, the diagram focus is mainly on the security related configuration to allow a new Device to function within an OCF environment. Onboarding typically begins with the Device becoming an Owned Device followed by configuring the Device for the environment that it will operate in. This would include setting information such as who may access the Device and what actions may be performed as well as what permissions the Device has for interacting with other Devices.
5.3.3 Establishing a Device Owner

The objective behind establishing Device ownership is to allow the OCF Security Domain Owner to assert itself as the owner and manager of the Device and introduce the Device into the OCF Security Domain.
Security Domain. This is done through the use of a DOTS that includes the creation of an ownership context between the new Device and the DOTS and asserts operational control and management of the Device. The DOTS is hosted on an OBT.

The DOTS uses one of the OTMs specified in 7.3 to securely establish Device ownership.

An OTM establishes a new owner (the operator of DOTS) that is authorized to manage the Device. Ownership Transfer accomplishes the following:

- The DOTS provisions an Owner Credential (OC) to the "creds" Property in the "/oic/sec/cred" Resource of the Device. This OC allows the Device and DOTS to mutually authenticate during subsequent interactions. The OC associates the DOTS Device UUID with the "owneruuid" Property of the "/oic/sec/doxm" Resource establishing it as the resource owner.
- The Device owner establishes trust in the Device through the OTM.
- Provisioning of appropriate credentials for the Device to be a member of the OCF Security Domain.

5.3.4 Provisioning for Normal Operation

Once the Device has the necessary information to initiate provisioning, the next step is to provision additional security configuration that allows the Device to become operational. This may include setting various parameters and may also involve multiple steps. Also provisioning of ACL’s for the various Resources hosted by the Server on the Device is done at this time. The provisioning step is not limited to this stage only. Device provisioning may happen at multiple stages in the Device’s operational lifecycle. However specific security related provisioning of Resource and Property state would likely happen at this stage at the end of which, each Device reaches the "Ready for Normal Operation" (RFNOP) State. The RFNOP State is consistent and well defined regardless of the specific OTM used or regardless of the variability in what gets provisioned. However individual OTM mechanisms and provisioning steps may specify additional configuration of Resources and Property states. The minimal mandatory configuration required for a Device to be in RFNOP state is specified in 8.

5.3.5 Device Provisioning for OCF Cloud and Device Registration Overview – moved to OCF Cloud Security Specification

This clause is intentionally left blank.

5.3.6 OCF Compliance Management System

The OCF Compliance Management System (OCMS) is a service maintained by the OCF that provides Certification status and information for OCF Devices.

The OCMS shall provide a JSON-formatted Certified Product List (CPL), hosted at the URI: https://www.openconnectivity.org/certification/ocms-cpl.json

The OBT shall possess the Root Certificate needed to enable https connection to the URI https://www.openconnectivity.org/certification/ocms-cpl.json.

The OBT should periodically refresh its copy of the CPL via the URI https://www.openconnectivity.org/certification/ocms-cpl.json, as appropriate to OCF Security Domain owner policy requirements.

5.4 Provisioning

5.4.1 Provisioning General

OCF security provisioning includes processes during and after the ownership transfer like configuration of credentials for interacting with provisioning services, configuration of any security related Resources and credentials for interacting with any services or Devices that the provisioned Device needs to contact later on.
The Device needs to engage with the CMS and AMS to be provisioned with:

- Security credentials through a CMS, which is currently assumed to be embedded in the same OBT as the DOTS.
- Access control policies and ACLs through an AMS, which is currently assumed to be embedded in the same OBT as the DOTS.

To be able to support the use of distinct device management services, some Device Secure Virtual Resources (SVRs) have an associated Resource owner identified in the Resource's rowneruuid Property.

The "rowneruuid" Property of the "/oic/sec/doxm" and "/oic/sec/pstat" resources identifies the DOTS.

The "rowneruuid" Property of the "/oic/sec/cred" resource identifies the CMS.

The "rowneruuid" Property of the "/oic/sec/acl2" resource identifies the AMS.

The DOTS provisions credentials that enable secure connections between OCF Services and the new Device. The DOTS initiates client-directed provisioning by signaling the OCF Service.

5.4.2 Access Control Provisioning

ACL provisioning is performed over a secure connection between the AMS and its Devices. The AMS provisions the ACL by updating the Device's ACL Resource.

5.4.3 Credential Provisioning

The CMS securely provisions credentials for Device-to-Device interactions using the CMS credential provisioned by the DOTS during the onboarding procedure. The CMS is also expected to proactively monitor the credentials installed on the Device and update them when needed (e.g. close to the expiration date).

5.4.4 Role Provisioning

The Servers, receiving requests for Resources they host, need to verify the role identifier(s) asserted by the Client requesting the Resource and compare that role identifier(s) with the constraints described in the Server's ACLs. Thus, a Client may need to be provisioned with one or more role credentials. Once provisioned, the Client can assert the role it is using as described in 10.4.2, if it has a certificate role credential.

Each Device holds the assertable role(s) information as a Property within the Credential Resource.

Each Device holds the asserted role(s) information as Properties within the Roles Resource.

All asserted roles are used in ACL enforcement. When a server has multiple roles asserted for a Client, access to a Resource is granted if it would be granted under any of the roles.

5.5 Secure Resource Manager (SRM)

SRM plays a key role in the overall security operation. In short, SRM performs both management of SVR and access control for requests to access and manipulate Resources. SRM consists of 3 main functional elements:

- A Resource manager (RM): responsible for 1) Loading SVRs from persistent storage (using PSI) as needed. 2) Supplying the Policy Engine (PE) with Resources upon request. 3) Responding to requests for SVRs. While the SVRs are in SRM memory, the SVRs are in a format that is consistent with device-specific data store format. However, the RM will use JSON format to marshal SVR data structures before being passed to PSI for storage, or travel off-device.
– A Policy Engine (PE) that takes requests for access to SVRs and based on access control policies responds to the requests with either "ACCESS_GRANTED" or "ACCESS_DENIED". To make the access decisions, the PE consults the appropriate ACL and looks for best Access Control Entry (ACE) that can serve the request given the subject (Device or role) that was authenticated by DTLS.

– Persistent Storage Interface (PSI): PSI provides a set of APIs for the RM to manipulate files in its own memory and storage. The SRM design is modular such that it may be implemented in the Platform’s secure execution environment; if available.

Figure 7 depicts OCF’s SRM Architecture.

Figure 7 – OCF’s SRM Architecture

5.6 Credential Overview

Devices may use credentials to prove the identity and role(s) of the parties in the Client to Server communication. Credentials may be symmetric or asymmetric. Each Device stores secret and public parts of its own credentials where applicable, as well as credentials for other Devices that have been provisioned by the DOTS or a CMS. These credentials may then be used in the establishment of secure communication sessions (e.g. using DTLS). Role certificates may be used after an authenticated session is established to assert one or more roles for a Device.

The credential types available within this document include:

– Pairwise symmetric keys
– Certificates
– Raw asymmetric keys

Devices may not support all of these credential types. The set of supported credential types for any Device is contained in its "sct" Property of the "/oic/sec/doxm" Resource.

5.7 Event Logging

5.7.1 Event Logging General

An OCF Platform can generate various kinds of Auditable Events. These Auditable Events can be used for log analysis or for real-time understanding of a system condition. Usually multiple...
Auditable Events are stored to backtrack problems that have occurred in the system. The storage capacity of IoT devices is typically very limited, so a specific type of data structure such as a ring buffer is often used.

An OCF Device logs Auditable Event Entries (AEE) for all Auditable Events that satisfy the "categoryfilter" and "priorityfilter" Properties of the "/oic/sec/ael" Resource. The AEEs are stored in local storage (see Figure 1). Due to the limited size of the local storage, OCF Security Domain Owner is expected to adjust the filtering options.

Figure 8 – Store Events in local storage
6 Security for the Discovery Process

6.1 Preamble

The main function of a discovery mechanism is to provide Universal Resource Identifiers (URIs, called links) for the Resources hosted by the Server, complemented by attributes about those Resources and possible further link relations. (in accordance to clause 10 in ISO/IEC 30118-1:2018)

6.2 Security Considerations for Discovery

When defining discovery process, care must be taken that only a minimum set of Resources are exposed to the discovering entity without violating security of sensitive information or privacy requirements of the application at hand. This includes both data included in the Resources, as well as the corresponding metadata.

To achieve extensibility and scalability, this document does not provide a mandate on discoverability of each individual Resource. Instead, the Server holding the Resource will rely on ACLs for each Resource to determine if the requester (the Client) is authorized to see/handle any of the Resources.

The "/oic/sec/acl2" Resource contains ACL entries governing access to the Server hosted Resources. (See 13.5)

Aside from the privacy and discoverability of Resources from ACL point of view, the discovery process itself needs to be secured. This document sets the following requirements for the discovery process:

1) Providing integrity protection for discovered Resources.

2) Providing confidentiality protection for discovered Resources that are considered sensitive.

The discovery of Resources is done by doing a RETRIEVE operation (either unicast or multicast) on the known "/oic/res" Resource.

The discovery request is sent over a non-secure channel (multicast or unicast without DTLS), a Server cannot determine the identity of the requester. In such cases, a Server that wants to authenticate the Client before responding can list the secure discovery URI (e.g. coaps://IP:PORT/oic/res ) in the unsecured "/oic/res" Resource response. This means the secure discovery URI is by default discoverable by any Client. The Client will then be required to send a separate unicast request using DTLS to the secure discovery URI.

For example, a Client with Device UUID "d1" (UUID:"0685B960-736F-46F7-BEC0-9E6CBD61ADC1") makes a RETRIEVE request on the "/door" Resource hosted on a Server with Device UUID "d3" where d3 has the ACL2s:

```
{
  "aclist2": [
    {
      "subject": {"uuid": "0685B960-736F-46F7-BEC0-9E6CBD61ADC1"},
      "resources": ["href":"/door"],
      "permission": 2, // RETRIEVE
      "aceid": 1
    },
    {
      "subject": {"authority": "owner", "role": "owner"}
      "resources": ["href":"/door"],
      "permission": 2, // RETRIEVE
    }
  ]
}
```
The ACL indicates that Client "d1" has RETRIEVE permissions on the Resource. Hence when device "d1" does a discovery on the "/door" Resource of the Server "d3", the response will include all the URIs in the "/door" Resource. Client "d2" without a Role ID "owner" will get an error response that includes no URI.

Discovery results delivered to d1 regarding d3's "/door" Resource from the secure interface:

```json
[
  {
    "href": "/door",
    "rel": "self",
    "rt": ["oic.wk.col"],
    "if": ["oic.if.ll", "oic.if.b", "oic.if.baseline"],
    "eps": [{"ep": "coaps://[2001:db8:a::b1d4]:55555"}]
  },
  {
    "href": "/door/lock",
    "rt": ["oic.r.lock.status "],
    "if": ["oic.if.a", "oic.if.baseline"],
    "eps": [{"ep": "coaps://[2001:db8:a::b1d4]:55555"}]
  }
]```
7 Security Provisioning

7.1 Device Identity

7.1.1 General Device Identity

A Device shall be identified by a Device UUID value that is established as part of the device onboarding and contained in the "deviceuuid" Property of the "/oic/sec/doxm" Resource. Device UUIDs shall be unique within the scope of the corresponding OCF Security Domain, and are expected to be randomly generated and provisioned by the OBT. The DOTS is expected to verify that the chosen new Device UUID does not conflict with Device UUIDs previously introduced into the OCF Security Domain.

Devices maintain an association of their Device UUIDs and their own cryptographic credential(s) via "/oic/sec/cred" Resource. The identity is cryptographically bound in case of a certificate credential, or is bound via internal mappings in the "/oic/sec/cred" Resource otherwise. The "/oic/sec/cred" Resource maintains a list of a Device's own and other Device's credentials. Multiple credentials may be associated with the same Device UUID. A Device is expected to only present credentials associated with its own Device UUID for peer authentication purposes. Devices regard the "/oic/sec/cred" Resource as authoritative when verifying authentication credentials of a peer Device.

In case of an authenticated connection, the Device UUID is treated as a Client's identity for purposes of the Access Control check for the target Resource. The Device UUID of a Client is matched against the Subject UUIDs in the pre-provisioned entries of Server's "/oic/sec/acl2" Resource. The Server determines Client's Device UUID based on the credential used for the establishment of the session.

An OCF Platform, which may host multiple Devices, is identified by a Platform ID. The Platform ID is globally unique and inserted in the device in an integrity protected manner (e.g. inside secure storage or signed and verified).

An OCF Platform may have a secure execution environment, used to secure unique identifiers and secrets. If a Platform hosts multiple Devices, some mechanism is needed to provide each Device with the appropriate and separate security context.

7.1.2 Device Identity for Devices with UAID [Deprecated]

This clause is intentionally left blank.

7.2 Device Ownership

This is an informative clause. Devices are logical entities that are security endpoints that have an identity that is authenticable using cryptographic credentials. A Device is Unowned when it is first initialized. Establishing device ownership is a process by which the device asserts its identity to the DOTS and the DOTS provisions an owner identity. This exchange results in the device changing its ownership state, thereby preventing a different DOTS from asserting administrative control over the device.

The ownership transfer process starts with the OBT discovering a new device that is in Unowned state through examination of the "Owned" Property of the "/oic/sec/doxm" Resource of the new device. At the end of ownership transfer, the following is accomplished:

1) The DOTS establishes a secure session with new device.

2) Optionally asserts any of the following:
   a) Proximity (using PIN) of the OBT to the Platform.
   b) Manufacturer's certificate asserting Platform vendor, model and other Platform specific attributes.
3) Determines the device identifier.
4) Determines the device owner.
5) Specifies the device owner (e.g. Device UUID of the OBT).
6) Provisions the device with owner’s credentials.
7) Sets the "Owned" state of the new device to TRUE.

7.3 Device Ownership Transfer Methods

7.3.1 OTM implementation requirements

This document provides specifications for several methods for ownership transfer. Implementation of each individual ownership transfer method is considered optional. However, each device shall implement at least one of the ownership transfer methods not including vendor specific methods.

All OTMs included in this document are considered optional. Each vendor is required to choose and implement at least one of the OTMs specified in this document. The OCF, does however, anticipate vendor-specific approaches will exist. Should the vendor wish to have interoperability between a vendor-specific OTM and OBTs from other vendors, the vendor must work directly with OBT vendors to ensure interoperability. Notwithstanding, standardization of OTMs is the preferred approach. In such cases, a set of guidelines is provided in 7.3.7 to help vendors in designing vendor-specific OTMs.

The "/oic/sec/doxm" Resource is extensible to accommodate vendor-defined owner transfer methods (OTM). The DOTS determines which OTM is most appropriate to onboard the new Device. All OTMs shall represent the onboarding capabilities of the Device using the "oxms" Property of the "/oic/sec/doxm" Resource. The DOTS queries the Device’s supported credential types using the "credtype" Property of the "/oic/sec/cred" Resource. The DOTS and CMS provision credentials according to the credential types supported.

Figure 9 depicts new Device discovery sequence.

---

**Figure 9 – Discover New Device Sequence**

1. **GET /oic/sec/doxm?owned=FALSE**
2. **RSP {..."oxms":[]}**
3. **GET /oic/sec/cred**
4. **RSP {..."credtype":[]}**
5. **SET /oic/sec/doxm**
6. **RSP {..."owned":TRUE, "deviceuuid":"FA1CExxx-..."}**

---

Table 1 – Discover New Device Details

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>The DOTS queries to see if the new device is not yet owned.</td>
</tr>
<tr>
<td>2</td>
<td>The new device returns the &quot;/oic/sec/doxm&quot; Resource containing ownership status and supported OTMs. It also contains a temporal Device UUID that may change subsequent to successful owner transfer. The device should supply a temporal ID to facilitate discovery as a guest device. Clause 7.3.9 provides security considerations regarding selecting an OTM.</td>
</tr>
</tbody>
</table>

Vendor-specific device OTMs shall adhere to the "/oic/sec/doxm" Resource Specification for OCs that results from vendor-specific device OTM. Vendor-specific OTM should include provisions for establishing trust in the new Device by the DOTS and optionally establishing trust in the OBT by the new Device.

The new device may have to perform some initialization steps at the beginning of an OTM. For example, if the Random PIN Based OTM is initiated, the new device may generate a random PIN value. The DOTS updates the oxmsel property of "/oic/sec/doxm" to the value corresponding to the OTM being used, before performing other OTM steps. This update notifies the new device that ownership transfer is starting.

The end state of a vendor-specific OTM shall allow the new Device to authenticate to the OBT and the OBT to authenticate to the new device.

Additional provisioning steps may be performed subsequent to owner transfer success leveraging the established OTM session.

7.3.2 SharedKey Credential Calculation

The SharedKey credential is derived using a PRF that accepts the key_block value resulting from the DTLS handshake used for onboarding. The new Device shall use the following calculation to ensure interoperability across vendor products (the DOTS performs the same calculation):

$$\text{SharedKey} = \text{PRF} (\text{Secret}, \text{Message})$$

Where:

- PRF shall use TLS 1.2 PRF defined by IETF RFC 5246 clause 5.
- Secret is the key_block resulting from the DTLS handshake
  - See IETF RFC 5246 clause 6.3
  - The length of key_block depends on cipher suite.
    - (e.g. 96 bytes for TLS_ECDHE_ECDSA_WITH_AES_128_CBC_SHA256, 40 bytes for TLS_PSK_WITH_AES_128_CCM_8)
- Message is a concatenation of the following:
  - DoxmType string for the current onboarding method (e.g. "oic.sec.doxm.jw")
    - See clause 13.2.2 for specific DoxmTypes
  - Owner ID is a UUID identifying the device owner identifier and the device that maintains SharedKey.
    - Use raw bytes as specified in IETF RFC 4122 clause 4.1.2
  - Device UUID is new device’s UUID
    - Use raw bytes as specified in IETF RFC 4122 clause 4.1.2
  - SharedKey Length will be 32 octets.
    - If subsequent DTLS sessions use 128 bit encryption cipher suites the left most 16 octets will be used. DTLS sessions using 256-bit encryption cipher suites will use all 32 octets.
7.3.3 Certificate Credential Generation

The Certificate Credential will be used by Devices for secure bidirectional communication. The certificates will be issued by a CMS or an external certificate authority (CA). This CA will be used to mutually establish the authenticity of the Device.

7.3.4 Just-Works OTM

7.3.4.1 Just-Works OTM General

Just-works OTM creates a symmetric key credential that is a pre-shared key used to establish a secure connection through which a device should be provisioned for use within the owner’s OCF Security Domain. Provisioning additional credentials and Resources is a typical step following ownership establishment. The pre-shared key is called SharedKey.

The DOTS selects the Just-works OTM using the "oxmsel" Property of the "/oic/sec/doxm" Resource and establishes a DTLS session using a ciphersuite defined for the Just-works OTM.

Just Works OTM sequence is shown in Figure 10 and steps described in Table 2.
### Table 2 – A Just Works OTM Details

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1, 2</td>
<td>The DOTS notifies the Device that it selected the &quot;Just Works&quot; method.</td>
</tr>
</tbody>
</table>
| 3 - 8 | A DTLS session is established using anonymous Diffie-Hellman.  

a This method assumes the operator is aware of the potential for man-in-the-middle attack and has taken precautions to perform the method in a clean-room network.

#### 7.3.4.2 Security Considerations

Anonymous Diffie-Hellman key agreement is subject to a man-in-the-middle attacker. Use of this method presumes that both the DOTS and the new device perform the "just-works" method assumes onboarding happens in a relatively safe environment absent of an attack device.

This method doesn’t have a trustworthy way to prove the Device UUID asserted is reliably bound to the device.

The new device should use a temporal Device UUID prior to transitioning to an owned device while it is considered a guest device to prevent privacy sensitive tracking. The device asserts a non-temporal Device UUID that could differ from the temporal value during the secure session in which owner transfer exchange takes place. The DOTS verifies the asserted Device UUID does not conflict with a Device UUID already in use. If it is already in use the existing credentials are used to establish a secure session.

An un-owned Device that also has established device credentials might be an indication of a corrupted or compromised device.

#### 7.3.5 Random PIN based OTM

##### 7.3.5.1 Random PIN based OTM General

The Random PIN method establishes physical proximity between the new device and the OBT can prevent man-in-the-middle attacks. The Device generates a random number that is communicated to the DOTS over an Out of Band Communication Channel. The definition of an Out of Band Communication Channel is outside the scope of the definition of device OTMs. The DOTS and new Device use the PIN in a key exchange as evidence that an End User authorized the transfer of ownership by having physical access to the new Device via the Out-of-Band Communication Channel.

##### 7.3.5.2 Random PIN based Owner Transfer Sequence

Random PIN-based OTM sequence is shown in Figure 11 and steps described in Table 3.
Table 3 – Random PIN-based OTM Details

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1, 2</td>
<td>The DOTS notifies the Device that it selected the “Random PIN” method.</td>
</tr>
<tr>
<td>3 - 8</td>
<td>A DTLS session is established using PSK-based Diffie-Hellman ciphersuite. The PIN is supplied as the PSK parameter. The PIN is randomly generated by the new device then communicated via an Out of Band Communication Channel that establishes proximal context between the new device and the DOTS. The security principle is the attack device will be unable to intercept the PIN due to a lack of proximity.</td>
</tr>
</tbody>
</table>

The following requirements apply to the DTLS handshake messages for this OTM:

- The new Device shall set the "psk_identity_hint" field of the ServerKeyExchange message to the "deviceuuid" Property of the "/oic/sec/doxm" Resource being sent in responses when the new Device is in RFOTM and when a Device Onboarding Connection is not currently established.
- The new Device determines that the Random PIN-based OTM is being applied if the "psk_identity" field of the ClientKeyExchange message matches the string "oic.sec.doxm.rdp".
If the Random PIN-based OTM is being applied, then the new Device shall apply the key derivation below.

NOTE: The string "oic.sec.doxm.rdp" is the URN defined for the Random PIN-based OTM in Table 18 and is included to allow future OTMs to re-use the DTLS ciphersuites without confusion about which OTM should be applied.

This OTM uses a pseudo-random function (PBKDF2) defined by IETF RFC 2898 and a PIN exchanged via an Out of Band Communication Channel to generate a pre-shared key. The PIN-authenticated pre-shared key (PPSK) is supplied to TLS ciphersuites that accept a PSK.

- $\text{PPSK} = \text{PBKDF2}(\text{PRF}, \text{PIN}, \text{Device UUID}, c, \text{dkLen})$

The PBKDF2 function has the following parameters:

- PRF – Uses the TLS 1.2 PRF defined by IETF RFC 5246.
- PIN – obtained via Out of Band Communication Channel.
- Device UUID – the "deviceuuid" Property of the "/oic/sec/doxm" Resource being sent in responses when the new Device is in RFOTM and when a Device Onboarding Connection is not currently established.

Use raw bytes as specified in IETF RFC 4122 clause 4.1.2

- $c$ – Iteration count initialized to 1000
- $\text{dkLen}$ – Desired length of the derived PSK in octets.

### 7.3.5.3 Security Considerations

Security of the Random PIN mechanism depends on the entropy of the PIN. Using a PIN with insufficient entropy may allow a man-in-the-middle attack to recover any long-term credentials provisioned as a part of onboarding. In particular, learning the provisioned symmetric key credentials allows an attacker to masquerade as the onboarded device.

It is recommended that the entropy of the PIN be enough to withstand an online brute-force attack, 40 bits or more. For example, a 12-digit numeric PIN, or an 8-character alphanumeric (0-9a-z), or a 7-character case-sensitive alphanumeric PIN (0-9a-zA-Z). A man-in-the-middle attack (MITM) is when the attacker is active on the network and can intercept and modify messages between the DOTS and device. In the MITM attack, the attacker must recover the PIN from the key exchange messages in "real time", i.e., before the peer's time out and abort the connection attempt. Having recovered the PIN, he can complete the authentication step of key exchange. The guidance given here calls for a minimum of 40 bits of entropy, however, the assurance this provides depends on the resources available to the attacker. Given the parallelizable nature of a brute force guessing attack, the attack enjoys a linear speedup as more cores/threads are added. A more conservative amount of entropy would be 64 bits. Since the Random PIN OTM requires using a DTLS ciphersuite that includes an ECDHE key exchange, the security of the Random PIN OTM is always at least equivalent to the security of the JustWorks OTM.

The Random PIN OTM also has an option to use PBKDF2 to derive key material from the PIN. The rationale is to increase the cost of a brute force attack, by increasing the cost of each guess in the attack by a tuneable amount (the number of PBKDF2 iterations). In theory, this is an effective way to reduce the entropy requirement of the PIN. Unfortunately, it is difficult to quantify the reduction, since an X-fold increase in time spent by the honest peers does not directly translate to an X-fold increase in time by the attacker. This asymmetry is because the attacker may use specialized implementations and hardware not available to honest peers. For this reason, when deciding how much entropy to use for a PIN, it is recommended that implementers assume PBKDF2 provides no security, and ensure the PIN has sufficient entropy.

The Random PIN device OTM security depends on an assumption that a secure Out of Band Communication Channel for communicating a randomly generated PIN from the new device to the OBT exists. If the Out of Band Communication Channel leaks some or the entire PIN to an attacker,
this reduces the entropy of the PIN, and the attacks described above apply. The Out of Band Communication Channel should be chosen such that it requires proximity between the DOTS and the new device. The attacker is assumed to not have compromised the Out of Band Communication Channel. As an example Out of Band Communication Channel, the device may display a PIN to be entered into the OBT software. Another example is for the device to encode the PIN as a 2D barcode and display it for a camera on the DOTS device to capture and decode.

7.3.6 Manufacturer Certificate Based OTM

7.3.6.1 Manufacturer Certificate Based OTM General

The manufacturer certificate-based OTM shall use a certificate embedded into the device by the manufacturer and may use a signed OBT, which determines the Trust Anchor between the device and the DOTS.

Manufacturer embedded certificates do not necessarily need to chain to an OCF Root CA trust anchor.

For some environments, policies or administrators, additional information about device characteristics may be sought. This list of additional attestations that OCF may or may not have tested (understanding that some attestations are incapable of testing or for which testing may be infeasible or economically unviable) can be found under the OCF Security Claims x509.v3 extension described in 9.4.2.2.6.

When utilizing certificate-based ownership transfer, devices shall utilize asymmetric keys with certificate data to authenticate their identities with the DOTS in the process of bringing a new device into operation on an OCF Security Domain. The onboarding process involves several discrete steps:

1) Pre-on-board conditions

a) The credential element of the Device’s credential Resource ("/oic/sec/cred") containing the manufacturer certificate shall be identified by the "credusage" Property containing the string "oic.sec.cred.mfgcert" to indicate that the credential contains a manufacturer certificate.

b) The manufacturer certificate chain shall be contained in the identified credential element’s "publicdata" Property.

c) The device shall contain a unique and immutable ECC asymmetric key pair.

d) If the device requires authentication of the DOTS as part of ownership transfer, it is presumed that the DOTS has been registered and has obtained a certificate for its unique and immutable ECC asymmetric key pair signed by the predetermined Trust Anchor.

e) An End User has configured the DOTS app with network access info and account info (if any).

2) The DOTS authenticates the Device using ECDSA to verify the signature. Additionally, the Device may authenticate the DOTS to verify the DOTS signature.

3) If authentication fails, the Device shall indicate the reason for failure and return to the Ready for OTM state. If authentication succeeds, the Device shall establish an encrypted link with the DOTS in accordance with the negotiated cipher suite.

7.3.6.2 Certificate Profiles

See 9.4.2 for details.

7.3.6.3 Certificate Owner Transfer Sequence Security Considerations

The OBT shall authenticate the device during onboarding. The device will not authenticate the OBT. During the DTLS handshake the server shall not send a Certificate Request.

7.3.6.5 Security Considerations

The manufacturer certificate private key is embedded in the Platform with a sufficient degree of assurance that the private key cannot be compromised.

The Platform manufacturer issues the manufacturer certificate and attests the private key protection mechanism.

7.3.7 Vendor Specific OTMs

7.3.7.1 Vendor Specific OTM General

The OCF anticipates situations where a vendor will need to implement an OTM that accommodates manufacturing or Device constraints. The Device OTM resource is extensible for this purpose. Vendor-specific OTMs must adhere to a set of conventions that all OTMs follow.

- The OBT must determine which credential types are supported by the Device. This is accomplished by querying the Device’s "/oic/sec/doxm" Resource to identify supported credential types.
- The OBT provisions the Device with OC(s).
- The OBT supplies the Device UUID and credentials for subsequent access to the OBT.
- The OBT will supply second carrier settings sufficient for accessing the owner’s OCF Security Domain subsequent to ownership establishment.
- The OBT may perform additional provisioning steps but must not invalidate provisioning tasks to be performed by a security service.

7.3.7.2 Vendor-specific Owner Transfer Sequence Example

Vendor-specific OTM sequence example is shown in Figure 13 and steps described in Table 5.
### Figure 13 – Vendor-specific Owner Transfer Sequence

<td>The vendor-specific OTM is applied</td>
</tr>
</tbody>
</table>

### 7.3.7.3 Security Considerations

The vendor is responsible for considering security threats and mitigation strategies.

### 7.3.8 Establishing Owner Credentials

Once the OBT and the new Device have authenticated and established an encrypted connection using one of the defined OTM methods, the Owner Credential(s) can be provisioned.

The Owner Credential is provisioned as part of Ownership Transfer Method, and may be provisioned directly by CMS.

The steps for establishing Device's owner credentials (OC) as part of OTM are:

1. The OBT establishes the Device UUID and Device Owner Id.
2. The OBT then establishes Device’s symmetric OC - See Figure 14 and Table 6.
3. Configure Device services.
4. Configure Device for peer to peer interaction.
Symmetric Owner Credential (OC) Assignment Sequence

**Owner Credential Agreement**

1. Derive a shared symmetric key as the credential for subsequent connections with the OBT, if using symmetric credentials.

   - `SharedKey = PRF (MasterSecret, "ocic.sec.exm.mldgcert", "uuid:" + OBT.uuid + "", "uuid:" + NewDevice.uuid + ", " + "68")`

   - Generate `{... "credtype":1, "subjectuuid":A71C3xxx..., "credid":1, "privatdata":{"encoding":"ocic.sec.encoding.base64", "data":<SharedKey>}, ...}`

   - `UPDATE ocic/securecred ("credid":{... "credtype":1, "subjectuuid":"808xxxxxx...", "credid":1, "privatdata":{"encoding":"ocic.sec.encoding.base64", "data":""}},...)...

2. Derive SharedKey Locally

3. Replace the "privatdata" of received credential

**Device Assignment**

4. Assign device to a Device Owner Transfer Service and save owner credential.

   - Create necessary resources for managing the new device, A71C3xxx-

   - Save the new device's owner credential details for subsequent integrity checks and re-provisioning.

   - Add a credential to the on boarding device's ocic/securecred resource that identifies A71C3xxx-

</tbody>
</table>
| 8   | The onboarding service provisions its "/oic/svc/dots/subjects/A71C3xxx/-cred" resource with
In particular when OBT establishes symmetric owner credentials as part of OTM sequence:

- The OBT generates a Shared Key using the SharedKey Credential Calculation method described in 7.3.2.
- The OBT sends an empty key to the new Device’s "/oic/sec/cred" Resource, identified as a symmetric pair-wise key. The Subject UUID of the "/oic/sec/cred" entry shall match the Device UUID of the OBT.
- Upon receipt of the OBT’s symmetric owner credential, the new Device shall independently generate the Shared Key using the SharedKey Credential Calculation method described in 7.3.2 and store it with the owner credential.
- The new Device shall use the Shared Key owner credential(s) stored via the "/oic/sec/cred" Resource to authenticate the owner during subsequent connections.

7.3.9 Security considerations regarding selecting an Ownership Transfer Method - Moved to OCF Onboarding Tool Specification

This clause is intentionally left blank.

7.3.10 Security Profile Assignment

OCF Devices may have been evaluated according to an OCF Security Profile. Evaluation results could be accessed from a manufacturer’s certificate, OCF web server or other public repository. The DOTS reviews evaluation results to determine which OCF Security Profiles the OCF Device is authorized to possess and configures the Device with the subset of evaluated security profiles best suited for the OCF Security Domain owner’s intended segmentation strategy.

The OCF Device vendor shall set a manufacturer default value for the "supportedprofiles" Property of the "/oic/sec/sp" Resource to match those approved by OCF’s testing and certification process. The "currentprofile" Property of the "/oic/sec/sp" Resource shall be set to one of the values contained in the "supportedprofiles". The manufacturer default value shall be re-asserted when the Device transitions to RESET Device State.

The OCF Device shall only allow the "/oic/sec/sp" Resource to be updated when the Device is in one of the following Device States: RFO TM, RFPRO, SRESET and may not allow any update as directed by a Security Profile.

The DOTS may update the "supportedprofiles" Property of the "/oic/sec/sp" Resource with a subset of the OCF Security Profiles values the Device achieved as part of OCF Conformance testing. The DOTS may locate conformance results by inspecting manufacturer certificates supplied with the OCF Device by selecting the "credusage" Property of the "/oic/sec/cred" Resource having the value of "oic.sec.cred.mfgcert". The DOTS may further locate conformance results by visiting a well-known OCF web site URI corresponding to the ocfCPLAttributes extension fields (clause 9.4.2.2.7). The DOTS may select a subset of Security Profiles (from those evaluated by OCF conformance testing) based on a local policy.

As part of onboarding (while the OTM session is active) the DOTS should configure ACE entries to allow DOTS access subsequent to onboarding.

The DOTS should update the "currentprofile" Property of the "/oic/sec/sp" Resource with the value that most correctly depicts the OCF Security Domain owner’s intended Device deployment strategy.
The CMS may issue role credentials using the Security Profile value (e.g. the "sp-blue-v0 OID") to indicate the OCF Security Domain owner's intention to segment the OCF Security Domain according to a Security Profile. The CMS retrieves the supportedprofiles Property of the "/oic/sec/sp" Resource to select role names corroborated with the Device's supported Security Profiles when issuing role credentials.

If the CMS issues role credentials based on a Security Profile, the AMS supplies access control entries that include the role designation(s).

7.4 Provisioning

7.4.1 Provisioning Flows

7.4.1.1 Provisioning Flows General

As part of onboarding a new Device a secure channel is formed between the new Device and the OBT. Subsequent to the Device ownership status being changed to "owned", there is an opportunity to begin provisioning. The OBT provisions the support services that should be subsequently used to complete Device provisioning and on-going Device management.

The Device employs a Client-directed provisioning strategy. The "/oic/sec/pstat" Resource identifies the provisioning strategy and current provisioning status. The provisioning service should determine which provisioning strategy is most appropriate for the OCF Security Domain. See 13.8 for additional detail.

7.4.1.2 Client-directed Provisioning

Client-directed provisioning relies on a provisioning service that identifies Servers in need of provisioning then performs all necessary provisioning duties.

An example of Client-directed provisioning is shown in Figure 15 and steps described in Table 7.
Figure 15 – Example of Client-directed provisioning

Table 7 – Steps describing Client-directed provisioning

<table>
<thead>
<tr>

12 The secure session is closed.

7.4.1.3 Server-directed Provisioning [DEPRECATED]

This clause is intentionally left blank.

7.4.1.4 Server-directed Provisioning Involving Multiple Support Services [DEPRECATED]

This clause is intentionally left blank.

7.5 Device Provisioning for OCF Cloud – moved to OCF Cloud Security Specification

This clause is intentionally left blank.

8 Device Onboarding State Definitions

8.1 Device Onboarding General

As explained in 5.3, the process of onboarding completes after the ownership of the Device has been transferred and the Device has been provisioned with relevant configuration/services as explained in 5.4. The Figure 16 shows the various states a Device can be in during the Device lifecycle. Device shall reject any requests to perform a state transition not shown on Figure 16.

The "/pstat.dos.s." Property is RW by the "/oic/sec/pstat" resource owner (e.g. "doxs" service) so that the resource owner can remotely update the Device state. When the Device is in RFNOP or RFPRO, ACLs can be used to allow remote control of Device state by other Devices. When the Device state is SRESET the Device OC may be the only indication of authorization to access the Device. The Device owner may perform low-level consistency checks and re-provisioning to get the Device suitable for a transition to RFPRO.
As shown in the diagram, at the conclusion of the provisioning step, the Device comes in the "Ready for Normal Operation" state where it has all it needs in order to start interoperating with other Devices. Clause 8.5 specifies the minimum mandatory configuration that a Device shall hold in order to be considered as "Ready for Normal Operation".

In the event of power loss or Device failure, the Device should remain in the same state that it was in prior to the power loss / failure.

If a Device or resource owner OBSERVES "/pstat.dos.s", then transitions to SRESET will give early warning notification of Devices that may require SVR consistency checking.

In order for onboarding to function, the Device shall have the following Resources installed:

1) "/oic/sec/doxm" Resource
2) "/oic/sec/pstat" Resource
3) "/oic/sec/cred" Resource

The values contained in these Resources are specified in the state definitions in 8.2, 8.3, 8.4, 8.5 and 8.6.

8.2 Device Onboarding-Reset State Definition

The /pstat.dos.s = RESET state is defined as a "hard" reset to manufacturer defaults. Hard reset also defines a state where the Device asset is ready to be transferred to another party.

The Platform manufacturer should provide a physical mechanism (e.g. button) that forces Platform reset. All Devices hosted on the same Platform transition their Device states to RESET when the Platform reset is asserted.

The following Resources and their specific properties shall have the value as specified:

- The "owned" Property of the "/oic/sec/doxm" Resource shall transition to FALSE.
- The "devowneruuid" Property of the "/oic/sec/doxm" Resource shall be nil UUID.
- The "deviceuuid" Property of the "/oic/sec/doxm" Resource shall be set to the manufacturer default value.
- The "sct" Property of the "/oic/sec/doxm" Resource shall be reset to the manufacturer’s default value.
- The "oxmsel" Property of the "/oic/sec/doxm" Resource shall be reset to the manufacturer’s default value.
- The "isop" Property of the "/oic/sec/pstat" Resource shall be FALSE.
- The "dos" Property of the "/oic/sec/pstat" Resource shall be updated: dos.s shall equal "RESET" state.
- The "om" (operational modes) Property of the "/oic/sec/pstat" Resource shall be set to the manufacturer default value.
- The "sm" (supported operational modes) Property of the "/oic/sec/pstat" Resource shall be set to the manufacturer default value.
- The "rowneruuid" Property of "/oic/sec/pstat", "/oic/sec/doxm", "/oic/sec/acl2", and "/oic/sec/cred" Resources shall be nil UUID.
- The "usedspace" Property of the "/oic/sec/acl" Resource shall be set to 0.
– The "categoryfilter" Property of the "/oic/sec/ael" Resource shall be set to the manufacturer's default value.
– The "priorityfilter" Property of the "/oic/sec/ael" Resource shall be set to the manufacturer's default value.
– The "events" Property of the "/oic/sec/ael" Resource shall be set to an empty array.
– The "supportedprofiles" Property of the "/oic/sec/sp" Resource shall be set to the manufacturer default value.
– The "currentprofile" Property of the "/oic/sec/sp" Resource shall be set to the manufacturer default value.
– The "uuid" Property of the Resource shall be set to nil UUID
– The "name" Property of the Resource shall be set to the empty string
– The "priv" Property of the Resource shall be set to FALSE

8.3 Device Ready-for-OTM State Definition
The following Resources and their specific properties shall have the value as specified when the Device enters ready for ownership transfer:
– The "owned" Property of the "/oic/sec/doxm" Resource shall be FALSE and will transition to TRUE.
– The "devowneruuid" Property of the "/oic/sec/doxm" Resource shall be nil UUID.
– The "deviceuuid" Property of the "/oic/sec/doxm" Resource shall be set to the manufacturer default value.
– The "isop" Property of the "/oic/sec/pstat" Resource shall be FALSE.
– The "dos" of the "/oic/sec/pstat" Resource shall be updated: "dos.s" shall equal "RFOTM" state.
– The "/oic/sec/cred" Resource shall contain credential(s) if required by the selected OTM

8.4 Device Ready-for-Provisioning State Definition
The following Resources and their specific properties shall have the value as specified when the Device enters ready for provisioning:
– The "owned" Property of the "/oic/sec/doxm" Resource shall be TRUE.
– The "devowneruuid" Property of the "/oic/sec/doxm" Resource shall not be nil UUID.
– The "deviceuuid" Property of the "/oic/sec/doxm" Resource shall not be nil UUID and shall be set to the value that was determined during RFOTM processing.
– The "oxmsel" Property of the "/oic/sec/doxm" Resource shall have the value of the actual OTM used during ownership transfer.
– The "isop" Property of the "/oic/sec/pstat" Resource shall be FALSE.
– The "dos" of the "/oic/sec/pstat" Resource shall be updated: "dos.s" shall equal "RFPRO" state.
– The "rowneruuid" Property of every installed Resource shall be set to a valid Resource owner (i.e. an entity that is authorized to instantiate or update the given Resource). Failure to set a "rowneruuid" may result in an orphan Resource.
– The "/oic/sec/cred" Resource shall contain credentials for each entity referenced by "rowneruuid" and "devowneruuid" Properties.
– All requests to the "/oic/sec/roles" Resource received over a mutually-authenticated connection established using an identity certificate shall be granted, regardless of the configuration of the ACEs in the "/oic/sec/acl2" Resource, subject to the conditions in clause 10.4.2.
8.5 Device Ready-for-Normal-Operation State Definition

The following Resources and their specific properties shall have the value as specified when the Device enters ready for normal operation:

- The "owned" Property of the "/oic/sec/doxm" Resource shall be TRUE.
- The "devowneruuid" Property of the "/oic/sec/doxm" Resource shall not be nil UUID.
- The "deviceuuid" Property of the "/oic/sec/doxm" Resource shall not be nil UUID and shall be set to the ID that was configured during OTM. Also the value of the "di" Property in "/oic/d" shall be the same as the deviceuuid.
- The "oxmsel" Property of the "/oic/sec/doxm" Resource shall have the value of the actual OTM used during ownership transfer.
- The "isop" Property of the "/oic/sec/pstat" Resource shall be set to TRUE by the Server once transition to RFNOP is otherwise complete.
- The "dos" of the "/oic/sec/pstat" Resource shall be updated: "dos.s" shall equal "RFNOP" state.
- The "rowneruuid" Property of every installed Resource shall be set to a valid resource owner (i.e. an entity that is authorized to instantiate or update the given Resource). Failure to set a "rowneruuid" results in an orphan Resource.
- The "/oic/sec/cred" Resource shall contain credentials for each service referenced by "rowneruuid" and "devowneruuid" Properties.
- All requests to the "/oic/sec/roles" Resource received over a mutually-authenticated connection established using an identity certificate shall be granted, regardless of the configuration of the ACEs in the "/oic/sec/acl2" Resource, subject to the conditions in clause 10.4.2.

8.6 Device Soft Reset State Definition

The soft reset state is defined (e.g. "/pstat.dos.s" = SRESET) where entrance into this state means the Device is not operational but remains owned by the current owner. The Device may exit SRESET by authenticating to a DOTS (e.g. "rt" = "oic.r.doxs") using the OC provided during original onboarding (but should not require use of an OTM /doxm.oxms).

If the DOTS credential cannot be found or is determined to be corrupted, the Device state transitions to RESET. The Device should remain in SRESET if the DOTS credential fails to validate the DOTS. This mitigates denial-of-service attacks that may be attempted by non-DOTS Devices.

When in SRESET, the following Resources and their specific Properties shall have the values as specified.

- The "owned" Property of the "/oic/sec/doxm" Resource shall be TRUE.
- The "devowneruuid" Property of the "/oic/sec/doxm" Resource shall remain non-null.
- The "deviceuuid" Property of the "/oic/sec/doxm" Resource shall remain non-null.
- The "sct" Property of the "/oic/sec/doxm" Resource shall retain its value.
- The "oxmsel" Property of the "/oic/sec/doxm" Resource shall retains its value.
- The "isop" Property of the "/oic/sec/pstat" Resource shall be FALSE.
- The "/oic/sec/pstat.dos.s" Property shall be SRESET.
- The "om" (operational modes) Property of the "/oic/sec/pstat" Resource shall be "client-directed mode".
- The "sm" (supported operational modes) Property of "/oic/sec/pstat" Resource may be updated by the Device owner (aka DOTS).
- The "rowneruuid" Property of "/oic/sec/pstat", "/oic/sec/doxm", "/oic/sec/acl2", and "/oic/sec/cred" Resources may be reset by the Device owner (aka DOTS) and re-provisioned.
– All requests to the "/oic/sec/roles" Resource received over a mutually-authenticated connection established using an identity certificate shall be granted, regardless of the configuration of the ACEs in the "/oic/sec/acl2" Resource, subject to the conditions in clause 10.4.2.
9 Security Credential Management

9.1 Preamble
This clause provides an overview of the credential types in OCF, along with details of credential use, provisioning and ongoing management.

9.2 Credential Lifecycle
9.2.1 Credential Lifecycle General
OCF credential lifecycle has the following phases: (1) creation, (2) deletion, (3) refresh and (4) revocation.

9.2.2 Creation
The CMS can provision credentials to the credential Resource onto the Device. The Device shall verify the CMS is authorized by matching the rowneruuid Property of the "/oic/sec/cred" Resource to the DeviceID of the credential the CMS used to establish the secure connection.

Credential Resources created using a CMS may involve specialized credential issuance protocols and messages. These may involve the use of public key infrastructure (PKI) such as a certificate authority (CA), symmetric key management such as a key distribution centre (KDC) or as part of a provisioning action by a DOTS, CMS or AMS.

9.2.3 Deletion
The CMS can delete credentials from the credential Resource. The Device (e.g. the Device where the credential Resource is hosted) should delete credential Resources that have expired.

An expired credential Resource may be deleted to manage memory and storage space.

Deletion in OCF key management is equivalent to credential suspension.

9.2.4 Refresh
Credential refresh may be performed before it expires. The CMS performs credential refresh.

The "/oic/sec/cred" Resource supports expiry using the Period Property. Credential refresh may be applied when a credential is about to expire or is about to exceed a maximum threshold for bytes encrypted.

A credential refresh method specifies the options available when performing key refresh. The Period Property informs when the credential should expire. The Device may proactively obtain a new credential using a credential refresh method using current unexpired credentials to refresh the existing credential. If the Device does not have an internal time source, the current time should be obtained from a CMS at regular intervals.

If the onboarding established credentials are allowed to expire the DOTS shall re-onboard the Device to re-apply device owner transfer steps.

All Devices shall support at least one credential refresh method.

9.2.5 Revocation
Credentials issued by a CMS may be equipped with revocation capabilities. In situations where the revocation method involves provisioning of a revocation object that identifies a credential that is to be revoked prior to its normal expiration period, a credential Resource is created containing the revocation information that supersedes the originally issued credential. The revocation object expiration should match that of the revoked credential so that the revocation object is cleaned up upon expiry.
It is conceptually reasonable to consider revocation applying to a credential or to a Device. Device revocation asserts all credentials associated with the revoked Device should be considered for revocation. Device revocation is necessary when a Device is lost, stolen or compromised. Deletion of credentials on a revoked Device might not be possible or reliable.

9.3 Credential Types

9.3.1 Preamble

The "/oic/sec/cred" Resource maintains a credential type Property that supports several cryptographic keys and other information used for authentication and data protection. The credential types supported include symmetric pair-wise key, group symmetric group key, asymmetric signing key, asymmetric signing key with certificate and shared-secret (i.e. PIN or password). The Device shall always support symmetric pair-wise key and asymmetric signing key with certificate credential types. Other credential types are optional.

9.3.2 Pair-wise Symmetric Key Credentials

The CMS shall provision exactly one other pair-wise symmetric credential to a peer Device. The CMS should not store pair-wise symmetric keys it provisions to managed Devices.

Pair-wise keys could be established through ad-hoc key agreement protocols.

The "PrivateKeyData" Property in the "/oic/sec/cred" Resource contains the symmetric key.

The "PublicData" Property may contain a token encrypted to the peer Device containing the pair-wise key.

The "OptionalData" Property may contain revocation status.

The Device implementer should apply hardened key storage techniques that ensure the "PrivateKeyData" remains private.

The Device implementer should apply appropriate integrity, confidentiality and access protection of the "/oic/sec/cred", "/oic/sec/roles", "/oic/sec/csr" Resources to prevent unauthorized modifications.

9.3.3 Group Symmetric Key Credentials

Group keys are symmetric keys shared among a group of Devices (3 or more). Group keys are used for efficient sharing of data among group participants.

Group keys do not provide authentication of Devices but only establish membership in a group.

The CMS shall provision group symmetric key credentials to the group members. The CMS maintains the group memberships.

The "PrivateKeyData" Property in the "/oic/sec/cred" Resource contains the symmetric key.

The "PublicData" Property may contain the group name.

The "OptionalData" Property may contain revocation status.

The Device implementer should apply hardened key storage techniques that ensure the "PrivateKeyData" remains private.

The Device implementer should apply appropriate integrity, confidentiality and access protection of the "/oic/sec/cred", "/oic/sec/roles", "/oic/sec/csr" Resources to prevent unauthorized modifications.
9.3.4  Asymmetric Authentication Key Credentials

9.3.4.1  Asymmetric Authentication Key Credentials General
Asymmetric authentication key credentials contain either a public and private key pair or only a public key. The private key is used to sign Device authentication challenges. The public key is used to verify a device authentication challenge-response.

The "PrivateData" Property in the "/oic/sec/cred" Resource contains the private key.

The "PublicData" Property contains the public key.

The "OptionalData" Property may contain revocation status.

The Device implementer should apply hardened key storage techniques that ensure the "PrivateData" remains private.

Devices should generate asymmetric authentication key pairs internally to ensure the private key is only known by the Device. See 9.3.4.2 for when it is necessary to transport private key material between Devices.

The Device implementer should apply appropriate integrity, confidentiality and access protection of the "/oic/sec/cred", "/oic/sec/roles", "/oic/sec/csr" Resources to prevent unauthorized modifications.

9.3.4.2  External Creation of Asymmetric Authentication Key Credentials
Devices should employ industry-standard high-assurance techniques when allowing off-device key pair creation and provisioning. Use of such key pairs should be minimized, particularly if the key pair is immutable and cannot be changed or replaced after provisioning.

When used as part of onboarding, these key pairs can be used to prove the Device possesses the manufacturer-asserted properties in a certificate to convince a DOTS or a user to accept onboarding the Device. See 7.3.3 for the OTM that uses such a certificate to authenticate the Device, and then provisions new OCF Security Domain credentials for use.

9.3.5  Asymmetric Key Encryption Key Credentials
The asymmetric key-encryption-key (KEK) credentials are used to wrap symmetric keys when distributing or storing the key.

The "PrivateData" Property in the "/oic/sec/cred" Resource contains the private key.

The "PublicData" Property contains the public key.

The "OptionalData" Property may contain revocation status.

The Device implementer should apply hardened key storage techniques that ensure the "PrivateData" remains private.

The Device implementer should apply appropriate integrity, confidentiality and access protection of the "/oic/sec/cred", "/oic/sec/roles", "/oic/sec/csr" Resources to prevent unauthorized modifications.

9.3.6  Certificate Credentials
Certificate credentials are asymmetric keys that are accompanied by a certificate issued by a CMS or an external certificate authority (CA).

A certificate enrolment protocol is used to obtain a certificate and establish proof-of-possession.
The issued certificate is stored with the asymmetric key credential Resource.

Other objects useful in managing certificate lifecycle such as certificate revocation status are associated with the credential Resource.

Either an asymmetric key credential Resource or a self-signed certificate credential is used to terminate a path validation.

The "PrivateData" Property in the "/oic/sec/cred" Resource contains the private key.

The "PublicData" Property contains the issued certificate.

The "OptionalData" Property may contain revocation status.

The Device implementer should apply hardened key storage techniques that ensure the PrivateData remains private.

The Device implementer should apply appropriate integrity, confidentiality and access protection of the "/oic/sec/cred", "/oic/sec/roles", "/oic/sec/csr" Resources to prevent unauthorized modifications.

9.3.7 Password Credentials

The "PrivateData" Property in the "/oic/sec/cred" Resource contains the PIN, password and other values useful for changing and verifying the password.

The "PublicData" Property may contain the user or account name if applicable.

The "OptionalData" Property may contain revocation status.

The Device implementer should apply hardened key storage techniques that ensure the "PrivateData" remains private.

The Device implementer should apply appropriate integrity, confidentiality and access protection of the "/oic/sec/cred", "/oic/sec/roles", "/oic/sec/csr" Resources to prevent unauthorized modifications.

9.4 Certificate Based Key Management

9.4.1 Overview

To achieve authentication and transport security during communications in OCF Security Domain, certificates containing public keys of communicating parties and private keys can be used.

The certificate and private key may be issued by a local or remote certificate authority (CA).

The OCF certificate format is a subset of X.509 format, only elliptic curve algorithm and PEM encoding format are allowed, most of optional fields in X.509 are not supported so that the format intends to meet the constrained Device’s requirement.

The CMS manages the certificate lifecycle for certificates it issues. The DOTS assigns a CMS to a Device when it is newly onboarded.

9.4.2 X.509 Digital Certificate Profiles

9.4.2.1 Digital Certificate Profile General

An OCF certificate format is a subset of X.509 format (version 3 or above) as defined in IETF RFC 5280.
This clause develops a profile to facilitate the use of X.509 certificates within OCF applications for those communities wishing to make use of X.509 technology. The X.509 v3 certificate format is described in detail, with additional information regarding the format and semantics of OCF specific extension(s). The supported standard certificate extensions are also listed.

Certificate Format: The OCF certificate profile is derived from IETF RFC 5280. However, this document does not support the "issuerUniqueID" and "subjectUniqueID" fields which are deprecated and shall not be used in the context of OCF. If these fields are present in a certificate, compliant entities shall ignore their contents.

Certificate Encoding: Conforming entities shall use the Privacy-Enhanced Mail (PEM) to encode certificates.

Certificates Hierarchy and Crypto Parameters. OCF supports a three-tier hierarchy for its Public Key Infrastructure (i.e., a Root CA, an Intermediate CA, and EE certificates). OCF accredited CAs SHALL use Elliptic Curve Cryptography (ECC) keys (secp256r1 – OID:1.2.840.10045.3.1.7) and use the ecdsaWithSHA256 (OID:1.2.840.10045.4.3.2) algorithm for certificate signatures. Elliptic Curve Cryptography public keys shall be encoded using uncompressed Elliptic Curve points.

The following clauses specify the supported standard and custom extensions for the OCF certificates profile.

9.4.2.2 Certificate Profile and Fields

9.4.2.2.1 Root CA Certificate Profile

Table 8 describes X.509 v1 fields required for Root CA Certificates.

### 9.4.2.2.4 OCF Compliance X.509v3 Extension

The OCF Compliance Extension defines required parameters to correctly identify the type of Device, its manufacturer, its OCF Version, and the Security Profile compliance of the device.

The extension carries an "ocfVersion" field which provides the specific base version of the OCF documents the device implements. The "ocfVersion" field shall contain a sequence of three integers ("major", "minor", and "build"). For example, if an entity is certified to be compliant with OCF specifications 1.3.2, then the "major", "minor", and "build" fields of the "ocfVersion" will be set to "1", "3", and "2" respectively. The "ocfVersion" may be used by Security Profiles to denote compliance to a specified base version of the OCF documents.

The "securityProfile" field shall carry the ocfSecurityProfile OID(s) (clause 14.8.3) of one or more supported Security Profiles associated with the certificate in string form (UTF-8). All Security Profiles associated with the certificate should be identified by this field.

The extension shall also carry two string fields (UTF-8): "DeviceName" and "deviceManufacturer". The fields carry human-readable descriptions of the Device’s name and manufacturer, respectively.

The ASN.1 definition of the OCFCompliance extension (OID – 1.3.6.1.4.1.51414.1.0) is defined as follows:

```plaintext
id-OCF OBJECT IDENTIFIER ::= { iso(1) identified-organization(3) dod(6) internet(1)
    private(4) enterprise(1) OCF(51414) }

id-ocfX509Extensions OBJECT IDENTIFIER ::= { id-OCF 1 }
```
id-ocfCompliance OBJECT IDENTIFIER ::= { id-ocfX509Extensions 0 }

ocfVersion ::= SEQUENCE {
  major INTEGER,
  --Major version number
  minor INTEGER,
  --Minor version number
  build INTEGER,
  --Build/Micro version number
}

ocfCompliance ::= SEQUENCE {
  version   ocfVersion,
  --Device/OCF version
  securityProfile  SEQUENCE SIZE (1..MAX) OF ocfSecurityProfileOID,
  --Sequence of OCF Security Profile OID strings
  deviceName  UTF8String,
  --Name of the device
  deviceManufacturer UTF8String,
  --Human-Readable Manufacturer
  --of the device
}

9.4.2.2.5  Manufacturer Usage Description (MUD) X.509v3 Extension

The goal of the Manufacturer Usage Description (MUD) extension is to provide a means for devices to signal to the network the access and network functionality they require to properly function. Access controls can be more easily achieved and deployed at scale when the MUD extension is used.

The MUD X.509 v3 extension is specified in IETF RFC 8520 with the full ASN.1 definition in section 11.

9.4.2.2.6  OCF Security Claims X.509v3 Extension

The OCF Security Claims Extension defines a list of OIDs representing security claims that the manufacturer/integrator is making as to the security posture of the device above those required by the OCF Compliance version or that of the OCF Security Profile being indicated by the device.

The purpose of this extension is to allow for programmatic evaluation of assertions made about security to enable some platforms/policies/administrators to better understand what is being onboarded or challenged.

The ASN.1 definition of the OCF Security Claims extension (OID – 1.3.6.1.4.1.51414.1.1) is defined as follows:

id-OCF OBJECT IDENTIFIER ::= { iso(1) identified-organization(3) dod(6) internet(1)
  private(4) enterprise(1) OCF(51414) }

id-ocfX509Extensions OBJECT IDENTIFIER ::= { id-OCF 1 }

id-ocfSecurityClaims OBJECT IDENTIFIER ::= { id-ocfX509Extensions 1 }

claim-secure-boot ::= ocfSecurityClaimsOID { id-ocfSecurityClaims 0 }
  --Device claims that the boot process follows a procedure trusted
  --by the firmware and the BIOS

claim-hw-backed-cred-storage ::= ocfSecurityClaimsOID { id-ocfSecurityClaims 1 }
  --Device claims that credentials are stored in a specialized hardware
  --protection environment such as a Trusted Platform Module (TPM) or
**9.4.2.2.7 OCF Certified Product List Attributes X.509v3 Extension**

The OCF Certified Product List Extension defines required parameters to utilize the OCF Compliance Management System Certified Product List (OCMS-CPL). This clause is only applicable if you plan to utilize the OCMS-CPL. The OBT may make use of these attributes to verify the compliance level of a device.

The extension carries the OCF CPL Attributes: IANA Private Enterprise Number (PEN), Model and Version.

The 'cpl-at-IANAPen' IANA Private Enterprise Number (PEN) provides the manufacturer's unique PEN established in the IANA PEN list located at: https://www.iana.org/assignments/enterprise-numbers. The 'cpl-at-IANAPen' field found in end-products shall be the same information as reported during OCF Certification.

The 'cpl-at-model' represents an OCF-Certified product's model name. The 'cpl-at-model' field found in end-products shall be the same information as reported during OCF Certification.

The 'cpl-at-version' represents an OCF-Certified product's version. The 'cpl-at-version' field found in end-products shall be the same information as reported during OCF Certification.

The ASN.1 definition of the OCF CPL Attributes extension (OID – 1.3.6.1.4.1.51414.1.2) is defined as follows:

```
ocfCPLAttributes ::= SEQUENCE {
    cpl-at-IANAPenUTF8String,
    --Manufacturer's registered IANA Private Enterprise Number
    cpl-at-model UTF8String,
    --Device OCF Security Profile
    cpl-at-version UTF8String,
    --Name of the device
}
```

**9.4.2.3 Supported Certificate Extensions**

As these certificate extensions are a standard part of IETF RFC 5280, this document includes the clause number from that RFC to include it by reference. Each extension is summarized here, and any modifications to the RFC definition are listed. Devices MUST implement and understand the extensions listed here; other extensions from the RFC are not included in this document and therefore are not required. 10.4 describes what Devices must implement when validating certificate chains, including processing of extensions, and actions to take when certain extensions are absent.

- Authority Key Identifier (4.2.1.1)
The Authority Key Identifier (AKI) extension provides a means of identifying the public key corresponding to the private key used to sign a certificate. This document makes the following modifications to the referenced definition of this extension:

The "authorityCertIssuer" or "authorityCertSerialNumber" fields of the "AuthorityKeyIdentifier" sequence are not permitted; only "keyIdentifier" is allowed. This results in the following grammar definition:

```plaintext
id-ce-authorityKeyIdentifier OBJECT IDENTIFIER ::= { id-ce 35 }

AuthorityKeyIdentifier ::= SEQUENCE {
  keyIdentifier             [0] KeyIdentifier           }

KeyIdentifier ::= OCTET STRING
```

– Subject Key Identifier (4.2.1.2)

The Subject Key Identifier (SKI) extension provides a means of identifying certificates that contain a particular public key.

This document makes the following modification to the referenced definition of this extension:

Subject Key Identifiers SHOULD be derived from the public key contained in the certificate's "SubjectPublicKeyInfo" field or a method that generates unique values. This document RECOMMENDS the 256-bit SHA-2 hash of the value of the BIT STRING "subjectPublicKey" (excluding the tag, length, and number of unused bits). Devices verifying certificate chains must not assume any particular method of computing key identifiers, however, and must only base matching AKI's and SKI's in certification path constructions on key identifiers seen in certificates.

– Subject Alternative Name

If the EKU extension is present, and has the value XXXXXX, indicating that this is a role certificate, the Subject Alternative Name (subjectAltName) extension shall be present and interpreted as described below. When no EKU is present, or has another value, the "subjectAltName" extension SHOULD be absent. The "subjectAltName" extension is used to encode one or more Role ID values in role certificates, binding the roles to the subject public key. The "subjectAltName" extension is defined in IETF RFC 5280 (See 4.2.1.6):

```plaintext
id-ce-subjectAltName OBJECT IDENTIFIER ::= { id-ce 17 }

SubjectAltName ::= GeneralNames

GeneralNames ::= SEQUENCE SIZE (1..MAX) OF GeneralName

GeneralName ::= CHOICE {
  otherName                       [0]     OtherName,
  rfc5322Name                     [1]     IA5String,
  dNSName                         [2]     IA5String,
  x400Address                     [3]     ORAddress,
  directoryName                   [4]     Name,
  ediPartyName                    [5]     EDIPartyName,
  uniformResourceIdentifier       [6]     IA5String,
  iPAddress                       [7]     OCTET STRING,
  registeredID                    [8]     OBJECT IDENTIFIER }

EDIPartyName ::= SEQUENCE {
  nameAssigner            [0]     DirectoryString OPTIONAL,
  partyName               [1]     DirectoryString }
```

Each "GeneralName" in the "GeneralNames" SEQUENCE which encodes a role shall be a "directoryName", which is of type Name. Name is an X.501 Distinguished Name. Each Name shall contain exactly one CN (Common Name) component, and zero or one OU (Organizational Unit) components. The OU component, if present, shall specify the authority that defined the
semantics of the role. If the OU component is absent, the certificate issuer has defined the role. The CN component shall encode the role ID. Other "GeneralName" types in the SEQUENCE may be present, but shall not be interpreted as roles. Therefore, if the certificate issuer includes non-role names in the "subjectAltName" extension, the extension should not be marked critical.

The role, and authority need to be encoded as ASN.1 "PrintableString" type, the restricted character set [0-9a-z-A-z '()+, -./:=?].

- **Key Usage (4.2.1.3)**
  The key usage extension defines the purpose (e.g., encipherment, signature, certificate signing) of the key contained in the certificate. The usage restriction might be employed when a key that could be used for more than one operation is to be restricted.

  This document does not modify the referenced definition of this extension.

- **Basic Constraints (4.2.1.9)**
  The basic constraints extension identifies whether the subject of the certificate is a CA and the maximum depth of valid certification paths that include this certificate. Without this extension, a certificate cannot be an issuer of other certificates.

  This document does not modify the referenced definition of this extension.

- **Extended Key Usage (4.2.1.12)**
  Extended Key Usage describes allowed purposes for which the certified public key may can be used. When a Device receives a certificate, it determines the purpose based on the context of the interaction in which the certificate is presented, and verifies the certificate can be used for that purpose.

  This document makes the following modifications to the referenced definition of this extension:

  CAs SHOULD mark this extension as critical.

  CAs MUST NOT issue certificates with the anyExtendedKeyUsage OID (2.5.29.37.0).

  The list of OCF-specific purposes and the assigned OIDs to represent them are:

  - Identity certificate 1.3.6.1.4.1.44924.1.6
  - Role certificate 1.3.6.1.4.1.44924.1.7

### 9.4.2.4 Cipher Suite for Authentication, Confidentiality and Integrity
OCF compliant entities shall support TLS version 1.2. Compliant entities shall support TLS_ECDHE_ECDSA_WITH_AES_128_CCM_8 cipher suite as defined in IETF RFC 7251 and may support additional ciphers as defined in the TLS v1.2 specifications.

### 9.4.2.5 Encoding of Certificate
See 9.4.2 for details.

### 9.4.3 Certificate Revocation List (CRL) Profile [Deprecated]
This clause is intentionally left blank.

### 9.4.4 Resource Model
Device certificates and private keys are kept in "cred" Resource.

The "cred" Resource contains the certificate information pertaining to the Device. The "PublicData" Property holds the device certificate and CA certificate chain. "PrivateData" Property holds the Device private key paired to the certificate. (See 13.3 for additional detail regarding the "/oic/sec/cred" Resource).
9.4.5 Certificate Provisioning

The CMS (e.g. a hub or a smart phone) issues certificates for new Devices.

The CA in the CMS retrieves a Device’s public key and proof of possession of the private key, generates a Device’s certificate signed by this CA certificate, and then the CMS transfers them to the Device including its CA certificate chain. Optionally, the CMS can also transfer one or more role certificates, which shall have the format described in clause 9.4.2. The "subjectPublicKey" of each role certificate shall match the "subjectPublicKey" in the Device certificate.

In the sequence in Figure 17, the Certificate Signing Request (CSR) is defined by PKCS#10 in IETF RFC 2986, and is included here by reference.

The sequence flow of a certificate transfer for a Client-directed model is described in Figure 17.

1) The CMS retrieves a CSR from the Device that requests a certificate. In this CSR, the Device shall place its requested UUID into the subject and its public key in the "SubjectPublicKeyInfo". The Device determines the public key to present; this may be an already-provisioned key it has selected for use with authentication, or if none is present, it may generate a new key pair internally and provide the public part. The key pair shall be compatible with the allowed ciphersuites listed in 9.4.2.4 and 11.3.4, since the certificate will be restricted for use in OCF authentication.

2) Alternatively, the CMS generates and provisions a private key and corresponding certificate directly to the Device.

3) The CMS transfers the issued certificate and CA chain to the designated Device using the same credid, to maintain the association with the private key. The credential type ("oic.sec.cred") used to transfer certificates in Figure 17 is also used to transfer role certificates, by including multiple credentials in the POST from CMS to Device. Identity certificates shall be stored with the credusage Property set to "oic.sec.cred.cert" and role certificates shall be stored with the credusage Property set to "oic.sec.cred.rolecert".

---

Figure 17 – Client-directed Certificate Transfer

---

9.4.6 CRL Provisioning [ Deprecated]

This clause is intentionally left blank.
10 Device Authentication

10.1 Device Authentication General
When a Client is accessing a restricted Resource on a Server, the Server shall authenticate the
Client. Clients shall authenticate Servers while requesting access. Clients may also assert one or
more roles that the server can use in access control decisions. Roles may be asserted when the
Device authentication is done with certificates.

10.2 Device Authentication with Symmetric Key Credentials
When using symmetric keys to authenticate, the Server Device shall include the
"ServerKeyExchange" message and set "psk_identity_hint" to the Server’s Device UUID. The Client
shall validate that it has a credential with the Subject UUID set to the Server’s Device UUID, and
a credential type of PSK. If it does not, the Client shall respond with an unknown_psk_identity error
or other suitable error.

If the Client finds a suitable PSK credential, it shall reply with a "ClientKeyExchange" message that
includes a "psk_identity" set to the Client’s Device UUID. The Server shall verify that it has a
credential with the matching Subject UUID and type. If it does not, the Server shall respond with
an "unknown_psk_identity" or other suitable error code. If it does, then it shall continue with the
DTLS protocol, and both Client and Server shall compute the resulting premaster secret.

10.3 Device Authentication with Raw Asymmetric Key Credentials
When using raw asymmetric keys to authenticate, the Client and the Server shall include a suitable
public key from a credential that is bound to their Device. Each Device shall verify that the provided
public key matches the Public Data field of a credential they have, and use the corresponding
Subject UUID of the credential to identify the peer Device.

10.4 Device Authentication with Certificates
10.4.1 Device Authentication with Certificates General
When using certificates to authenticate, the Client and Server shall each include their certificate
chain, as stored in the appropriate credential, as part of the selected authentication cipher suite.
Each Device shall validate the certificate chain presented by the peer Device. Each certificate
signature shall be verified until a public key is found within the "/oic/sec/cred" Resource with the
"oic.sec.cred.trustca" credusage.

Devices shall follow the certificate path validation algorithm in clause 6 of IETF RFC 5280. In
addition:

- For both End-Entity certificates and non-End-Entity certificates, Devices shall verify that
"notBefore" and "notAfter" fields in the certificates conform to IETF RFC 5280 clauses 4.1.2.5,
4.1.2.5.1, and 4.1.2.5.2.
- For non-End-Entity certificates, Devices shall verify that the Basic Constraints extension is
present, and that the "cA" boolean in the extension is TRUE. If any of these are false, the
certificate chain shall be rejected. If the pathLenConstraint field is present, Devices shall verify
that the number of certificates between this certificate and the End-Entity certificate is less than
or equal to "pathLenConstraint". In particular, if "pathLenConstraint" is zero, only an End-Entity
certificate can be issued by this certificate. If the "pathLenConstraint" field is absent, there is
no limit to the chain length.
- For End-Entity certificates, Devices shall verify that the Basic Constraints extension (if present)
has a "cA" boolean value of FALSE, and does not contain a "pathLenConstraint" ASN.1
sequence.
- For non-End-Entity certificates, Devices shall verify that the Key Usage extension is present,
and that the "keyCertSign" (5) bit is asserted.
– For End-Entity certificates, Devices shall verify that the Key Usage extension is present and that "digitalSignature" (0) and "keyAgreement" (4) bits are asserted.

– For End-Entity certificates, Devices shall verify that the Extended Key Usage (EPU) extension is present and suitable to the purpose for which it is being presented: Identity ("1.3.6.1.4.1.44924.1.6") or Role ("1.3.6.1.4.1.44924.1.7."). An End-Entity certificate which contains no EKU extension, or presents both identity and role OIDs is not valid and shall be rejected. Any certificate which contains the "anyExtendedKeyUsage" purpose ("2.5.29.37.0") shall be rejected, even if other valid EKUs are also present. For End-Entity certificates, Devices shall verify that the EKU extension also contains OIDs for "serverAuthentication" ("1.3.6.1.5.5.7.3.1") and "clientAuthentication" ("1.3.6.1.5.5.7.3.2") for compatibility with various TLS implementations.

– For End-Entity certificates which chain to an OCF Root CA, the Devices should verify that they contain at least one "PolicyIdentifierId" set to the OCF Certificate Policy OID – ("1.3.6.1.4.1.51414.0.1.2") corresponding to the version of the OCF Certificate Policy under which it was issued. Additional manufacturer-specific CP OIDs may also be populated. If the Device does not recognize an extension, it shall examine the "critical" field. If the field is TRUE, the Device shall reject the certificate. If the field is FALSE, the Device shall treat the certificate as if the extension were absent and proceed accordingly. This applies to all certificates in a chain.

A Device retrieves the Subject UUID from the "Common Name" component of the "Subject Name" property of the End-Entity certificate which has the following format: "uuid: X", where X is provisioned by the CMS to match the "deviceuuid" Property of the "/oic/sec/doxm" Resource. The Device treats all requests arriving over a connection authenticated by this End-Entity certificate as having originated from the Device with this Subject UUID. The Device shall use this Subject UUID to match against the "subjectuuid" Property of the provisioned ACL entries to perform access control checks.

10.4.2 Role Assertion with Certificates

This clause describes role assertion by a client to a server using a certificate role credential. Following authentication with a certificate, an OCF Client shall assert Roles by updating the Server’s "/oic/sec/roles" Resource with all the Role certificates it possesses, unless the device manufacturer provides a vendor-specific mechanism for End User to select which roles to assert. The Roles asserted are encoded in the "subjectAltName" extension in the certificate. The "subjectAltName" field can have multiple values, allowing a single certificate to encode multiple Roles that apply to the Client. The Server shall also check that the EKU extension of the Role certificate(s) contains the value "1.3.6.1.4.1.44924.1.7." (see clause 9.4.2.2) indicating the certificate may be used to assert Roles. Figure 18 describes how a Client Device asserts Roles to a Server.
Additional comments for Figure 18

1) The response shall contain "204 No Content" to indicate success or 4xx to indicate an error. If the server does not support certificate credentials, it should return "501 Not Implemented".

2) Roles asserted by the client may be kept for a duration chosen by the server. The duration shall not exceed the validity period of the role certificate.

3) Servers should choose a nonzero duration to avoid the cost of frequent re-assertion of a role by a client. It is recommended that servers use the validity period of the certificate as a duration, effectively allowing the CMS to decide the duration.

4) The format of the data sent in the create call shall be a list of credentials ("oic.sec.cred", see Table 19). They shall have "credtype" 8 (indicating certificates) and "PrivateData" field shall not be present. For fields that are duplicated in the "oic.sec.cred" object and the certificate, the value in the certificate shall be used for validation. For example, if the "Period" field is set in the credential, the server shall treat the validity period in the certificate as authoritative. Similar for the roleid data (authority, role).

5) Certificates shall be encoded as in Figure 17 (PEM-encoded certificate chain).

6) Clients may GET the "/oic/sec/roles" resource to determine the roles that have been previously asserted. An array of credential objects shall be returned. If there are no valid certificates corresponding to the currently connected and authenticated Client's identity, then an empty array (i.e. []) shall be returned.

10.4.3 OCF PKI Roots

This clause intentionally left empty.

10.4.4 PKI Trust Store

Each Device using a certificate chained to an OCF Root CA trust anchor SHALL securely store the OCF Root CA certificates in the "oic/sec/cred" resource and SHOULD physically store this resource in a hardened memory location where the certificates cannot be tampered with.

10.4.5 Path Validation and extension processing

See clause 10.3.
10.5 Device Authentication with OCF Cloud – moved to OCF Cloud Security Specification

This clause is intentionally left blank.
11 Message Integrity and Confidentiality

11.1 Preamble
Secured communications between Clients and Servers are protected against eavesdropping, tampering, or message replay, using security mechanisms that provide message confidentiality and integrity.

11.2 Session Protection with DTLS

11.2.1 DTLS Protection General
Devices shall support DTLS for secured communications as defined in IETF RFC 6347. Devices using TCP shall support TLS v1.2 for secured communications as defined in IETF RFC 5246. See 11.3 for a list of required and optional cipher suites for message communication.

OCF Devices MUST support (D)TLS version 1.2 or greater and MUST NOT support versions 1.1 or lower.

Multicast session semantics are not yet defined in this version of the security document.

11.2.2 Unicast Session Semantics
For unicast messages between a Client and a Server, both Devices shall authenticate each other. See clause 10 for details on Device Authentication.

Secured unicast messages between a Client and a Server shall employ a cipher suite from 11.3. The sending Device shall encrypt and authenticate messages as defined by the selected cipher suite and the receiving Device shall verify and decrypt the messages before processing them.

11.2.3 Cloud Session Semantics – moved to OCF Cloud Security Specification
This clause is intentionally left blank.

11.3 Cipher Suites

11.3.1 Cipher Suites General
The cipher suites allowed for use can vary depending on the context. This clause lists the cipher suites allowed during ownership transfer and normal operation. The following RFCs provide additional information about the cipher suites used in OCF.

IETF RFC 4279: Specifies use of pre-shared keys (PSK) in (D)TLS
IETF RFC 4492: Specifies use of elliptic curve cryptography in (D)TLS
IETF RFC 5489: Specifies use of cipher suites that use elliptic curve Diffie-Hellman (ECDHE) and PSKs
IETF RFC 6655 and IETF RFC 7251: Specifies AES-CCM mode cipher suites, with ECDHE

11.3.2 Cipher Suites for Device Ownership Transfer

11.3.2.1 Just Works Method Cipher Suites
The Just Works OTM may use the following (D)TLS cipher suites.

TLS_ECDH_ANON_WITH_AES_128_CBC_SHA256
All Devices supporting Just Works OTM shall implement:
TLS_ECDH_ANON_WITH_AES_128_CBC_SHA256 (with the value 0xFF00)
11.3.2.2 Random PIN Method Cipher Suites
The Random PIN Based OTM may use the following (D)TLS cipher suites.

TLS_ECDHE_PSK_WITH_AES_128_CBC_SHA256

All Devices supporting Random Pin Based OTM shall implement:

TLS_ECDHE_PSK_WITH_AES_128_CBC_SHA256

11.3.2.3 Certificate Method Cipher Suites
The Manufacturer Certificate Based OTM may use the following (D)TLS cipher suites.

TLS_ECDHE_ECDSA_WITH_AES_128_CCM_8,  
TLS_ECDHE_ECDSA_WITH_AES_256_CCM_8 ,  
TLS_ECDHE_ECDSA_WITH_AES_128_CCM,  
TLS_ECDHE_ECDSA_WITH_AES_256_CCM

Using the following curve:

secp256r1 (See IETF RFC 4492)

All Devices supporting Manufacturer Certificate Based OTM shall implement:

TLS_ECDHE_ECDSA_WITH_AES_128_CCM_8

Devices supporting Manufacturer Certificate Based OTM should implement:

TLS_ECDHE_ECDSA_WITH_AES_256_CCM_8,  
TLS_ECDHE_ECDSA_WITH_AES_128_CCM,  
TLS_ECDHE_ECDSA_WITH_AES_256_CCM

11.3.3 Cipher Suites for Symmetric Keys
The following cipher suites are defined for (D)TLS communication using PSKs:

TLS_ECDHE_PSK_WITH_AES_128_CBC_SHA256,  
TLS_PSK_WITH_AES_128_CCM_8, (* 8 OCTET Authentication tag *)  
TLS_PSK_WITH_AES_256_CCM_8,  
TLS_PSK_WITH_AES_128_CCM, (* 16 OCTET Authentication tag *)  
TLS_PSK_WITH_AES_256_CCM

All CCM based cipher suites also use HMAC-SHA-256 for authentication.

All Devices shall implement the following:

TLS_ECDHE_PSK_WITH_AES_128_CBC_SHA256,  

Devices should implement the following:

TLS_ECDHE_PSK_WITH_AES_128_CBC_SHA256,  
TLS_PSK_WITH_AES_128_CCM_8,  
TLS_PSK_WITH_AES_256_CCM_8,  
TLS_PSK_WITH_AES_128_CCM,  
TLS_PSK_WITH_AES_256_CCM
11.3.4 Cipher Suites for Asymmetric Credentials

The following cipher suites are defined for (D)TLS communication with asymmetric keys or certificates:

- TLS_ECDHE_ECDSA_WITH_AES_128_CCM_8,
- TLS_ECDHE_ECDSA_WITH_AES_256_CCM_8,
- TLS_ECDHE_ECDSA_WITH_AES_128_CCM,
- TLS_ECDHE_ECDSA_WITH_AES_256_CCM

Using the following curve:

- secp256r1 (See IETF RFC 4492)

All Devices supporting Asymmetric Credentials shall implement:

- TLS_ECDHE_ECDSA_WITH_AES_128_CCM_8

All Devices supporting Asymmetric Credentials should implement:

- TLS_ECDHE_ECDSA_WITH_AES_256_CCM_8,
- TLS_ECDHE_ECDSA_WITH_AES_128_CCM,
- TLS_ECDHE_ECDSA_WITH_AES_256_CCM

11.3.5 Cipher suites for OCF Cloud Credentials – moved to OCF Cloud Security Specification

This clause is intentionally left blank.
12 Access Control

12.1 ACL Generation and Management

This clause intentionally left empty.

12.2 ACL Evaluation and Enforcement

12.2.1 ACL Evaluation and Enforcement General

The Server enforces access control over application Resources before exposing them to the requestor. The Security Layer in the Server authenticates the requestor when access is received via the secure port. Authenticated requestors, known as the "subject" can be used to match ACL entries that specify the requestor's identity, role or may match authenticated requestors using a subject wildcard.

If the request arrives over the unsecured port, the only ACL policies allowed are those that use a subject wildcard match of anonymous requestors.

Access is denied if a requested Resource is not matched by an ACL entry.

NOTE There are documented exceptions pertaining to Device onboarding where access to Security Virtual Resources may be granted prior to provisioning of ACL Resources.

The second generation ACL (i.e. "/oic/sec/acl2") contains an array of Access Control Entries (ACE2) that employ a Resource matching algorithm that uses an array of Resource references to match Resources to which the ACE2 access policy applies. Matching consists of comparing the values of the ACE2 "resources" Property (see clause 13) to the requested Resource. Resources are matched in two ways:

1) host reference ("href")
2) resource wildcard ("wc").

12.2.2 Host Reference Matching

When present in an ACE2 matching element, the Host Reference (href) Property shall be used for Resource matching.

– The href Property shall be used to find an exact match of the Resource name if present.

12.2.3 Resource Wildcard Matching

When present, a wildcard ("wc") expression shall be used to match multiple Resources using a wildcard Property contained in the "oic.sec.ace2.resource-ref" structure.

A wildcard expression may be used to match multiple Resources using a wildcard Property contained in the "oic.sec.ace2.resource-ref" structure. The wildcard matching strings are defined in Table 14.

Table 14 – ACE2 Wildcard Matching Strings Description

<table>
<thead>
<tr>
<th>String</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;+&quot;</td>
<td>Shall match all Discoverable Non-Configuration Resources which expose at least one Secure OCF Endpoint.</td>
</tr>
<tr>
<td>&quot;-&quot;</td>
<td>Shall match all Discoverable Non-Configuration Resources which expose at least one Unsecure OCF Endpoint.</td>
</tr>
<tr>
<td>&quot;*&quot;</td>
<td>Shall match all Non-Configuration Resources.</td>
</tr>
</tbody>
</table>

NOTE Discoverable resources appear in the "/oic/res" Resource, while non-discoverable resources may appear in other collection resources but do not appear in the /res collection.
12.2.4 Multiple Criteria Matching

If the ACE2 "resources" Property contains multiple entries, then a logical OR shall be applied for each array element. For example, if a first array element of the "resources" Property contains 
"href="/a/light" and the second array element of the "resources" Property contains "href="/a/led",
then Resources that match either of the two "href" criteria shall be included in the set of matched Resources.

Example 1 JSON for Resource matching

```json
{
//Matches Resources named "/x/door1" or "/x/door2"
"resources":[
{
  "href ": "/x/door1"
},
{
  "href ": "/x/door2"
}
]
}
```

Example 2 JSON for Resource matching

```json
{
// Matches all Resources
"resources":[
{
  "wc": "+*
}
]
}
```

12.2.5 Subject Matching using Wildcards

When the ACE subject is specified as the wildcard string "***" any requestor is matched. The OCF server may authenticate the OCF client, but is not required to.

Examples: JSON for subject wildcard matching

```json
//matches all subjects that have authenticated and confidentiality protections in place.
"subject" : {
  "conntype" : "auth-crypt"
}

//matches all subjects that have NOT authenticated and have NO confidentiality protections in place.
"subject" : {
  "conntype" : "anon-clear"
}
```

12.2.6 Subject Matching using Roles

When the ACE subject is specified as a role, a requestor shall be matched if either:

1) The requestor authenticated with a symmetric key credential, and the role is present in the
   "roleid" Property of the credential's entry in the "credential" Resource, or
2) The requestor authenticated with a certificate, and a valid role certificate is present in the roles resource with the requestor's certificate's public key at the time of evaluation. Validating role certificates is defined in 10.3.1.

12.2.7 ACL Evaluation

12.2.7.1 ACE2 matching algorithm

The OCF Server shall apply an ACE2 matching algorithm that matches in the following sequence:

1) The local "/oic/sec/acl2" Resource contributes its ACE2 entries for matching.

2) Access shall be granted when all these criteria are met:
   a) The requestor is matched by the ACE2 "subject" Property.
   b) The requested Resource is matched by the ACE2 "resources" Property and the requested Resource shall exist on the local Server.
   c) The "period" Property constraint shall be satisfied.
   d) The "permission" Property constraint shall be applied.

If multiple ACE2 entries match the Resource request, the union of permissions, for all matching ACEs, defines the effective permission granted. E.g. If Perm1=CR---; Perm2=--UDN; Then UNION (Perm1, Perm2)=CRUDN.

The Server shall enforce access based on the effective permissions granted.

Batch requests to Resource containing Links require additional considerations when accessing the linked Resources. ACL considerations for batch request to the Atomic Measurement Resource Type are provided in clause 12.2.7.2. ACL considerations for batch request to the Collection Resource Type are provided in clause 12.2.7.3.

Clause 12.2.7.4 provides ACL considerations when a new Resource is created on a Server in response to a CREATE request.

12.2.7.2 ACL considerations for batch request to the Atomic Measurement Resource Type

The present clause shall apply to any Resource Type based on the Atomic Measurement Resource Type.

If an OCF Server receives a batch OCF Interface request to an Atomic Measurement Resource and there is an ACE matching the Atomic Measurement Resource which permits the request, then the corresponding requests to the linked Resources of the Atomic Measurement Resource shall be permitted by the OCF Server. That is, the request to each linked Resource is permitted regardless of whether there is an ACE configured on the OCF Server which would permit a corresponding request from the OCF Client (which sent the batch OCF Interface request to the Atomic Measurement Resource) addressing the linked Resource.

NOTE As specified in ISO/IEC 30118-1:2018, the linked Resources of an Atomic Measurement Resource are hosted on the same Device as the Atomic Measurement Resource.

12.2.7.3 ACL considerations for a batch OCF Interface request to a Collection

This clause addresses the additional authorization processes which take place when a Server receives a batch OCF Interface request from a Client to a Collection hosted on that Server, assuming there is an ACE matching the Collection which permits the original Client request. For the purposes of this clause, the Server hosting this Collection is called the "Collection host". The additional authorization process is dependent on whether the linked Resource is hosted on the Collection host or the linked Resource is hosted on another Server:
– For each generated request to a linked Resource hosted on the Collection host, the Collection host shall apply the ACE2 matching algorithm in clause 12.2.7.1 to determine whether the linked Resource is permitted to process the generated request, with the following clarifications:

– The requestor in clause 12.2.7.1 shall be the Client which sent the original Client request.

– The requested Resource in clause 12.2.7.1 shall be the linked Resource, which shall be matched using at least one of:

– a Resource Wildcard matching the linked Resource, or

– an exact match of the local path of the linked Resource with a "href" Property in the "resources" array in the ACE2.

– an exact match of the full URI of the linked Resource with a "href" Property in the "resources" array in the ACE2.

NOTE The full URI of a linked Resource is obtained by concatenating the "anchor" Property of the Link, if present, and the "href" Property of the Link. The local path can then be determined form the full URI.

If the linked Resource is not permitted to process the generated request, then the Collection host shall treat such cases as a linked Resource which cannot process the request when composing the aggregated response to the original Client Request, as specified for the batch OCF Interface in the ISO/IEC 30118-1:2018.

12.2.7.4 ACL Considerations on creation of a new Resource

When a new Resource is created on a Server in response to a CREATE request, there might be no ACEs permitting access to the newly created Resource. The present clause describes how the Server autonomously modifies the "/oic/sec/acl2" Resource to provide some initial authorizations for accessing the newly created Resource. The purpose of this autonomous modification is to avoid relying on the AMS update the "/oic/sec/acl2" Resource after every new Resource is created.

Subsequent to a Server creating a Collection inside another Collection in response to a CREATE request from a Client, and prior to sending a response to the Client:

– If there is an ACE with "subject" containing the UUID of the Client, and "permissions" exactly matching the CREATE, RETRIEVE, UPDATE and DELETE operations, then the Server shall autonomously add an "href" entry to "resources" with the URI of the newly created Collection.

– Otherwise, the Server shall autonomously add an ACE with "subject" containing the UUID of the Client, "resources" containing an "href" entry with the URI of the newly created Collection, and "permissions" exactly matching the CREATE, RETRIEVE, UPDATE and DELETE operations.

Subsequent to a Server creating a non-Collection Resource inside another Collection in response to a CREATE request from a Client, and prior to sending a response to the Client:

– If there is an ACE with "subject" containing the UUID of the Client, and "permissions" exactly matching the RETRIEVE, UPDATE and DELETE operations, then the Server shall autonomously add an "href" entry to "resources" with the URI of the newly created Resource.

– Otherwise, the Server shall autonomously add an ACE with "subject" containing the UUID of the Client, "resources" containing an "href" entry with the URI of the newly created, and "permissions" exactly matching the RETRIEVE, UPDATE and DELETE operations.
13 Security Resources

13.1 Security Resources General

OCF Security Resources are shown in Figure 19.

"/oic/sec/cred" Resource and Properties are shown in Figure 20.

"/oic/sec/acl2" Resource and Properties are shown in Figure 21.

Figure 19 – OCF Security Resources
Figure 20 – "/oic/sec/cred" Resource and Properties

Figure 21 – "/oic/sec/acl2" Resource and Properties
Figure 22 – "/oic/sec/ael" Resource and Properties

13.2 Device Owner Transfer Resource

13.2.1 Device Owner Transfer Resource General

The "/oic/sec/doxm" Resource contains the set of supported Device OTMs. Resource discovery processing respects the CRUDN constraints supplied as part of the security Resource definitions contained in this document. 

"/oic/sec/doxm" Resource is defined in Table 15.

Table 15 – Definition of the "/oic/sec/doxm" Resource

<table>
<thead>
<tr>
<th>Fixed URI</th>
<th>Resource Type Title</th>
<th>Resource Type ID (*rt&quot; value)</th>

</thead>
<tbody>
<tr>
<td>Device ID</td>
<td>uuid</td>
<td>String</td>
<td>uuid</td>
<td>Yes</td>
<td>RW</td>
<td>-</td>
<td>A uuid value</td>
</tr>
</tbody>
</table>

The "oxms" Property contains a list of OTM where the entries appear in the order of preference. This Property contains the higher priority methods appearing before the lower priority methods. The DOTS queries this list at the time of onboarding and selects the most appropriate method.

OTMs consist of two parts, a URI identifying the vendor or organization and the specific method.

```
<DoxmType> ::= <NSS>
<NSS> ::= <Identifier> | {{<NID>"."} <NameSpaceQualifier> "."} <Method>
<NID> ::= <Vendor-or-Organization>
<Identifier> ::= INTEGER
<NameSpaceQualifier> ::= String
<Method> ::= String
<Vendor-Organization> ::= String
```

When an OTM successfully completes, the "owned" Property is set to "1" (TRUE). Consequently, subsequent attempts to take ownership of the Device will fail.

There are four device identifiers:

1) "deviceuuid" Property of "/oic/sec/doxm" Resource - random DOTS-provisioned value unique for a given security domain, used as a device identity for access control, mapped internally to a device-owned credential.

2) "di" Property of "/oic/d" Resource - mirroring the value of "deviceuuid" Property of "/oic/sec/doxm" Resource.

13.2.2 OCF defined OTMs

Table 18 defines the Properties of the "oic.sec.doxmtype".
Table 18 – Properties of the “oic.sec.doxmtype” type

<table>
<thead>
<tr>
<th>Value Type Name</th>
<th>Value Type URN (optional)</th>
<th>Enumeration Value (mandatory)</th>
<th>Description</th>
</tr>
</thead>
</table>
| OCFJustWorks    | oic.sec.doxm.jw           | 0                            | The just-works method relies on anonymous Diffie-Hellman key agreement protocol to allow a DOTS to assert ownership of the new Device. The first DOTS to make the assertion is accepted as the Device owner. The just-works method results in a shared secret that is used to authenticate the Device to the DOTS and likewise authenticates the DOTS to the Device. The Device permits the DOTS to take ownership of the Device, after which a second attempt to take ownership by a different DOTS will fail.
| OCFSharedPin    | oic.sec.doxm.rdp          | 1                            | The new Device randomly generates a PIN that is communicated via an Out Of Band Communication Channel to a DOTS. An in-band Diffie-Hellman key agreement protocol establishes that both endpoints possess the PIN. Possession of the PIN by the DOTS signals the new Device that device ownership can be asserted.
| OCFMfgCert      | oic.sec.doxm.mfgcert      | 2                            | The new Device is presumed to have been manufactured with an embedded asymmetric private key that is used to sign a Diffie-Hellman exchange at Device onboarding. The manufacturer certificate should contain Platform hardening information and other security assurances assertions.
| OCF Reserved    | <Reserved>                | 3                            | Reserved |
| OCFSelf         | oic.sec.oxm.self          | 4                            | The manufacturer shall set the “/doxm.oxmsel” value to (4). The Server shall reset this value to (4) upon entering RESET Device state.
| OCF Reserved    | <Reserved>                | 5~0xFEFF                     | Reserved for OCF use |
| Vendor-defined Value Type Name | <Reserved> | 0xFF00~0xFFFF | Reserved for vendor-specific OTM use |

The just-works method is subject to a man-in-the-middle attacker. Precautions should be taken to provide physical security when this method is used.

13.3 Credential Resource

13.3.1 Credential Resource General

The "/oic/sec/cred" Resource maintains credentials used to authenticate the Server to Clients and support services as well as credentials used to verify Clients and support services. Multiple credential types are anticipated by the OCF framework, including pair-wise pre-shared keys, asymmetric keys, certificates and others. The credential Resource uses a Subject UUID to distinguish the Clients and support services it recognizes by verifying an authentication challenge.

In order to provide an interface which allows management of the "creds" Array Property, the RETRIEVE, UPDATE and DELETE operations on the "/oic/sec/cred" Resource shall behave as follows:

1) A RETRIEVE shall return the full Resource representation, except that any write-only Properties shall be omitted (e.g. private key data).
2) An UPDATE shall replace or add to the Properties included in the representation sent with the UPDATE request, as follows:
   a) If an UPDATE representation includes the "creds" array Property, then:
i) Supplied "creds" with a "credid" that matches an existing "credid" shall replace completely the corresponding "cred" in the existing "creds" array.

ii) Supplied "creds" without a "credid" shall be appended to the existing "creds" array, and a unique (to the "cred" Resource) "credid" shall be created and assigned to the new "cred" by the Server. The "credid" of a deleted "cred" should not be reused, to improve the determinism of the interface and reduce opportunity for race conditions.

iii) Supplied "creds" with a "credid" that does not match an existing "credid" shall be appended to the existing "creds" array, using the supplied "credid".

iv) The rows in Table 20 corresponding to the "creds" array Property dictate the Device States in which an UPDATE of the "creds" array Property is always rejected. If OCF Device is in a Device State where the Access Mode in this row contains "R", then the OCF Device shall reject all UPDATEs of the "creds" array Property.

3) A DELETE without query parameters shall set the "creds" array to the empty array, but shall not remove the "/oic/sec/cred" Resource.

4) A DELETE with one or more "credid" query parameters shall remove the "cred"(s) with the corresponding "credid"(s) from the "creds" array.

5) The rows in Table 20 corresponding to the "creds" array Property dictate the Device States in which a DELETE is always rejected. If OCF Device is in a Device State where the Access Mode in this row contains "R", then the OCF Device shall reject all DELETEs.

NOTE The "/oic/sec/cred" Resource’s use of the DELETE operation is not in accordance with the OCF Interfaces defined in ISO/IEC 30118-1:2018.

"/oic/sec/cred" Resource is defined in Table 19.

13.3.2 Properties of the Credential Resource

13.3.2.1 Credential ID

Credential ID ("credid") is a local reference to an entry in a "creds" Property array of the "/oic/sec/cred" Resource. The SRM generates it. The "credid" Property shall be used to disambiguate array elements of the "creds" Property.

13.3.2.2 Subject UUID

The "subjectuuid" Property identifies the Device to which an entry in a "creds" Property array of the "/oic/sec/cred" Resource shall be used to establish a secure session, verify an authentication challenge-response or to authenticate an authentication challenge.

A "subjectuuid" Property that matches the Server’s own "deviceuuid" Property, distinguishes the array entries in the "creds" Property that pertain to this Device.

The "subjectuuid" Property shall be used to identify a group to which a group key is used to protect shared data.

When certificate chain is used during secure connection establishment, the "subjectuuid" Property shall also be used to verify the identity of the responder. The presented certificate chain shall be accepted, if there is a matching Credential entry on the Device that satisfies all of the following:

- Public Data of the entry contains trust anchor (root) of the presented chain.
- Subject UUID of the entry matches UUID in the Common Name field of the End-Entity certificate in the presented chain. If Subject UUID of the entry is set as a wildcard "***", this condition is automatically satisfied.
- Credential Usage of the entry is "oic.sec.cred.trustca".
13.3.2.3 Role ID

The "roleid" Property identifies a role that has been granted to the credential.

13.3.2.4 Credential Type

The "credtype" Property is used to interpret several of the other Property values whose contents can differ depending on credential type. These Properties include "publicdata", "privatedata" and "optionaldata". The "credtype" Property value of "0" ("no security mode") is reserved for testing and debugging circumstances. Production deployments shall not allow provisioning of credentials of type "0". The SRM should introduce checking code that prevents its use in production deployments.

13.3.2.5 Public Data

The "publicdata" Property contains information that provides additional context surrounding the issuance of the credential. For example, it might contain information included in a certificate or response data from a CMS. It might contain wrapped data.

13.3.2.6 Private Data

The "privatedata" Property contains secret information that is used to authenticate a Device, protect data or verify an authentication challenge-response.

The "privatedata" Property shall not be disclosed outside of the SRM's trusted computing perimeter. A secure element (SE) or trusted execution environment (TEE) should be used to implement the SRM's trusted computing perimeter. The privatedata contents may be referenced using a handle; for example, if used with a secure storage sub-system.

13.3.2.7 Optional Data

The "optionaldata" Property contains information that is optionally supplied, but facilitates key management, scalability or performance optimization.

13.3.2.8 Period

The "period" Property identifies the validity period for the credential. If no validity period is specified, the credential lifetime is undetermined. Constrained devices that do not implement a date-time capability shall obtain current date-time information from its CMS.

13.3.2.9 Credential Refresh Method Type Definition [Deprecated]

This clause is intentionally left blank.

13.3.2.10 Credential Usage

Credential Usage indicates to the Device the circumstances in which a credential should be used. Five values are defined:

- "oic.sec.cred.trustca": This certificate is a trust anchor for the purposes of certificate chain validation, as defined in 10.4. OCF Server SHALL remove any "/oic/sec/cred" entries with an "oic.sec.cred.trustca" credusage upon transitioning to RFOTM. OCF Servers SHALL use "/oic/sec/cred" entries that have an "oic.sec.cred.trustca" Value of "credusage" Property only as trust anchors for post-onboarding (D)TLS session establishment in RFNOMP state; these entries are not to be used for onboarding (D)TLS sessions.

- "oic.sec.cred.cert": This "credusage" is used for certificates for which the Device possesses the private key and uses it for identity authentication in a secure session, as defined in clause 10.4.

- "oic.sec.cred.rolecert": This "credusage" is used for certificates for which the Device possesses the private key and uses to assert one or more roles, as defined in clause 10.4.2.

- "oic.sec.cred.mfgtrustca": This certificate is a trust anchor for the purposes of the Manufacturer Certificate Based OTM as defined in clause 7.3.6. OCF Servers SHALL use "/oic/sec/cred"
entries that have an "oic.sec.cred.mfgtrustca" Value of "credusage" Property only as trust anchors for onboarding (D)TLS session establishment; these entries are not to be used for post-onboarding (D)TLS sessions.

- "oic.sec.cred.mfgcert": This certificate is used for certificates for which the Device possesses the private key and uses it for authentication in the Manufacturer Certificate Based OTM as defined in clause 7.3.6.

13.3.11 Resource Owner

The Resource Owner Property allows credential provisioning to occur soon after Device onboarding before access to support services has been established. It identifies the entity authorized to manage the "/oic/sec/cred" Resource in response to Device recovery situations.

13.3.3 Key Formatting

13.3.3.1 Symmetric Key Formatting

Symmetric keys shall have the format described in Table 27 and Table 28.

<table>
<thead>
<tr>
<th>Name</th>
<th>Value</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Length</td>
<td>16</td>
<td>OCTET</td>
<td>Specifies the number of 8-bit octets following Length</td>
</tr>
<tr>
<td>Key</td>
<td>opaque</td>
<td>OCTET Array</td>
<td>16-byte array of octets. When used as input to a PSK function Length is omitted.</td>
</tr>
</tbody>
</table>

Table 28 – 256-bit symmetric key

<table>
<thead>
<tr>
<th>Name</th>

</tr>
</tbody>
</table>

13.3.3.2 Asymmetric Keys

Asymmetric key formatting is not available in this revision of the document.

13.3.3.3 Asymmetric Keys with Certificate

Key formatting is defined by certificate definition.

13.3.4 Passwords

Password formatting is not available in this revision of the document.

13.4 Certificate Revocation List

13.4.1 CRL Resource Definition [Deprecated]

This clause is intentionally left blank.

13.5 ACL Resources

13.5.1 ACL Resources General

All Resource hosted by a Server are required to match an ACL policy. ACL policies can be expressed using "/oic/sec/acl2". The subject (e.g. "deviceuuid" of the Client) requesting access to

a Resource shall be authenticated prior to applying the ACL check. Resources that are available
to multiple Clients can be matched using a wildcard subject. All Resources accessible via the
unsecured communication endpoint shall be matched using a wildcard subject.

### 13.5.2 OCF Access Control List (ACL) BNF defines ACL structures.

ACL structure in Backus-Naur Form (BNF) notation is defined in Table 29:

<table>
<thead>
<tr>
<th>Table 29 – BNF Definition of OCF ACL</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;ACL&gt;</code></td>
</tr>
<tr>

</tr>
<tr>
<td>ISO/IEC 30118-1:2018 defined in JSON Schema</td>
</tr>
<tr>
<td><code>&lt;Character&gt;</code></td>
</tr>
<tr>
<td><code>&lt;Any UTF8 printable character, excluding NUL&gt;</code></td>
</tr>
</tbody>
</table>

The `<DeviceId>` token means the requestor must possess a credential that uses `<UUID>` as its
identity in order to match the requestor to the `<ACE>` policy.

The `<RoleID>` token means the requestor must possess a role credential with `<Character>` as its
role in order to match the requestor to the `<ACE>` policy.

The `<Wildcard>` token `***` means any requestor is matched to the `<ACE>` policy, with or without
authentication.

When a `<SubjectId>` is matched to an `<ACE>` policy the `<ResourceRef>` is used to match the `<ACE>`
policy to Resources.

The `<OIC_LINK>` token contains values used to query existence of hosted Resources.

The `<Permission>` token specifies the privilege granted by the `<ACE>` policy given the `<SubjectId>`
and `<ResourceRef>` matching does not produce the empty set match.

Permissions are defined in terms of CREATE ("C"), RETRIEVE ("R"), UPDATE ("U"), DELETE ("D"),
NOTIFY ("N") and NIL ("-"). NIL is substituted for a permissions character that signifies the
respective permission is not granted.

The empty set match result defaults to a condition where no access rights are granted.

If the `<Validity>` token exists, the `<Permission>` granted is constrained to the time `<Period>`.
 `<Validity>` may further be segmented into a `<Recurrence>` pattern where access may alternatively
be granted and rescinded according to the pattern.
13.5.3 ACL Resource

An "acl2" is a list of type "ace2".

In order to provide an interface which allows management of array elements of the "aclist2" Property associated with a "/oic/sec/acl2" Resource, the RETRIEVE, UPDATE and DELETE operations on the"/oic/sec/acl2" Resource SHALL behave as follows:

1) A RETRIEVE shall return the full Resource representation.

2) An UPDATE shall replace or add to the Properties included in the representation sent with the UPDATE request, as follows:
   a) If an UPDATE representation includes the "aclist2" array Property, then:
      i) Supplied ACEs with an "aceid" that matches an existing "aceid" shall replace completely the corresponding ACE in the existing "aclist2" array.
      ii) Supplied ACEs without an "aceid" shall be appended to the existing "aclist2" array, and a unique (to the "/oic/sec/acl2" Resource) "aceid" shall be created and assigned to the new ACE by the Server. The "aceid" of a deleted ACE should not be reused, to improve the determinism of the interface and reduce opportunity for race conditions.
      iii) Supplied ACEs with an "aceid" that does not match an existing "aceid" shall be appended to the existing "aclist2" array, using the supplied "aceid".
      iv) The rows in Table 32 corresponding to the "aclist2" array Property dictate the Device States in which an UPDATE of the "aclist2" array Property is always rejected. If OCF Device is in a Device State where the Access Mode in this row contains "R", then the OCF Device shall reject all UPDATEs of the "aclist2" array Property.

3) A DELETE without query parameters shall set the "aclist2" array to the empty array, but shall not remove the "oic/sec/ace2" Resource.

4) A DELETE with one or more "aceid" query parameters shall remove the ACE(s) with the corresponding "aceid"(s) from the "aclist2" array.

5) The rows in Table 32 corresponding to the "aclist2" array Property dictate the Device States in which a DELETE is always rejected. If OCF Device is in a Device State where the Access Mode in this row contains "R", then the OCF Device shall reject all DELETEs.

NOTE The "/oic/sec/acl2" Resource's use of the DELETE operation is not in accordance with the OCF Interfaces defined in ISO/IEC 30118-1:2018.

Evaluation of local ACL Resource completes when all ACL Resource have been queried and no entry can be found for the requested Resource for the requestor – e.g. "/oic/sec/acl2" does not match the subject and the requested Resource.

</tbody>
</table>

Local ACL Resources supply policy to a Resource access enforcement point within an OCF stack instance. The OCF framework gates Client access to Server Resources. It evaluates the subject’s request using policies contained in ACL resources.

Resources named in the ACL policy can be fully qualified or partially qualified. Fully qualified Resource references include the device identifier in the href Property that identifies the remote Resource Server that hosts the Resource. Partially qualified references mean that the local Resource Server hosts the Resource. If a fully qualified resource reference is given, the Intermediary enforcing access shall have a secure channel to the Resource Server and the Resource Server shall verify the Intermediary is authorized to act on its behalf as a Resource access enforcement point.
Resource Servers should include references to Device and ACL Resources where access enforcement is to be applied. However, access enforcement logic shall not depend on these references for access control processing as access to Server Resources will have already been granted.

Local ACL Resources identify a Resource Owner service that is authorized to instantiate and modify this Resource. This prevents non-terminating dependency on some other ACL Resource. Nevertheless, it should be desirable to grant access rights to ACL Resources using an ACL Resource.

An ACE2 entry is considered "currently valid" if the validity period of the ACE2 entry includes the time of the request. The validity period in the ACE2 may be a recurring time period (e.g., daily from 1:00-2:00). Matching the resource(s) specified in a request to the "resource" Property of the ACE2 is defined in clause 12.2. For example, one way they can match is if the Resource URI in the request exactly matches one of the resource references in the ACE2 entries.

A request will match an ACE2 if any of the following are true:

1) The ACE2 "subject" Property is of type "oic.sec.didtype" has a UUID value that matches the "deviceuuid" Property associated with the secure session;
   AND the Resource of the request matches one of the "resources" Property of the ACE2 "oic.sec.ace2.resource-ref";
   AND the ACE2 is currently valid.

2) The ACE2 "subject" Property is of type "oic.sec.conntype" and has the wildcard value that matches the currently established connection type;
   AND the resource of the request matches one of the "resources" Property of the ACE2 "oic.sec.ace2.resource-ref";
   AND the ACE2 is currently valid.

3) When Client authentication uses a certificate credential;
   AND one of the "roleid" values contained in the role certificate matches the "roleid" Property of the ACE2 "oic.sec.roletype";
   AND the role certificate public key matches the public key of the certificate used to establish the current secure session;
   AND the resource of the request matches one of the array elements of the "resources" Property of the ACE2 "oic.sec.ace2.resource-ref";
   AND the ACE2 is currently valid.

4) When Client authentication uses a certificate credential;
   AND the CoAP payload query string of the request specifies a role, which is member of the set of roles contained in the role certificate;
   AND the roleid values contained in the role certificate matches the "roleid" Property of the ACE2 "oic.sec.roletype";
   AND the role certificate public key matches the public key of the certificate used to establish the current secure session;
   AND the resource of the request matches one of the "resources" Property of the ACE2 "oic.sec.ace2.resource-ref";
   AND the ACE2 is currently valid.

5) When Client authentication uses a symmetric key credential;
   AND one of the "roleid" values associated with the symmetric key credential used in the secure session, matches the "roleid" Property of the ACE2 "oic.sec.roletype";
AND the resource of the request matches one of the array elements of the "resources" Property of the ACE2 "oic.sec.ace2.resource-ref";

AND the ACE2 is currently valid.

6) When Client authentication uses a symmetric key credential;

AND the CoAP payload query string of the request specifies a role, which is contained in the "oic.r.cred.creds.roleid" Property of the current secure session;

AND CoAP payload query string of the request specifies a role that matches the "roleid" Property of the ACE2 "oic.sec.roletype";

AND the resource of the request matches one of the array elements of the "resources" Property of the ACE2 "oic.sec.ace2.resource-ref";

AND the ACE2 is currently valid.

A request is granted if ANY of the ‘matching’ ACE2 entries contain the permission to allow the request. Otherwise, the request is denied.

There is no way for an ACE2 entry to explicitly deny permission to a resource. Therefore, if one Device with a given role should have slightly different permissions than another Device with the same role, they must be provisioned with different roles.

The Server is required to verify that any hosted Resource has authorized access by the Client requesting access. The "/oic/sec/acl2" Resource is co-located on the Resource host so that the Resource request processing should be applied securely and efficiently. See Annex A for example.

13.6 Access Manager ACL Resource [Deprecated]

This clause is intentionally left blank.

13.7 Signed ACL Resource [Deprecated]

This clause is intentionally left blank.

13.8 Provisioning Status Resource

The "/oic/sec/pstat" Resource maintains the Device provisioning status. Device provisioning should be Client-directed or Server-directed. Client-directed provisioning relies on a Client device to determine what, how and when Server Resources should be instantiated and updated. Server-directed provisioning relies on the Server to seek provisioning when conditions dictate. Furthermore, the "/oic/sec/cred" Resource should be provisioned at ownership transfer with credentials necessary to open a secure connection with appropriate support service.

"/oic/sec/pstat" Resource is defined in Table 36.

<table>
<thead>
<tr>

In all Device states:

- The Device permits an authenticated and authorised Client to change the Device state of a Device by updating the "s" Property of the "dos" Property of the "/oic/sec/pstat" Resource to the desired value. The allowed Device state transitions are defined in Figure 16.
- Prior to updating the "s" Property of the "dos" Property of the "/oic/sec/pstat" Resource, the Client configures the Device to meet entry conditions for the new Device state. The SVR definitions define the entity (Client or Server) expected to perform the specific SVR configuration change to meet the entry conditions. Once the Client has configured the aspects for which the Client is responsible, it can update the "s" Property of the "dos" Property of the "/oic/sec/pstat" Resource. The Server then makes any changes for which the Server is responsible, including updating required SVR values, and set the "s" Property of the "dos" Property of the "/oic/sec/pstat" Resource to the new value.

**When Device state is RESET:**

- All SVR content is removed and reset to manufacturer default values.
- The default manufacturer Device state is RESET.
- NCRs are reset to manufacturer default values.
- NCRs shall not be accessible.
- After successfully processing RESET the SRM transitions to RFOTM by setting the "s" Property of the "dos" Property of the "/oic/sec/pstat" Resource to 1 (RFOTM).

**When Device state is RFOTM:**

- NCRs shall not be accessible.
- Before OTM is successful, the the "s" Property of the "dos" Property of the "/oic/sec/pstat" Resource is read-only by unauthenticated requestors.
- After the OTM is successful, the "s" Property of the "dos" Property of the "/oic/sec/pstat" Resource is read-write by authorized requestors.
- The negotiated Device OC is used to create an authenticated session over which the DOTS directs the Device state to transition to RFPRO.
– If an authenticated session cannot be established the ownership transfer session should be disconnected and SRM sets back the Device state to RESET state.
– Ownership transfer session, especially Random PIN OTM, should not exceed 60 seconds. If the SRM asserts the OTM failed, the ownership transfer session should be disconnected, and the Device should transition to RESET (/pstat.dos.s=0 (RESET)).
– The DOTS UPDATES the "devowneruuid" Property in the "/oic/sec/doxm" Resource to a non-nil UUID value. The DOTS (or other authorized client) can update it multiple times while in RFOTM. It is not updatable while in other device states except when the Device state returns to RFOTM through RESET.
– The DOTS can have additional provisioning tasks to perform while in RFOTM. When done, the DOTS UPDATES the "owned" Property in the "/oic/sec/doxm" Resource to "true".
– After successful OTM, the DOTS triggers the transition to RFPRO state and the "s" Property of the "dos" Property of the "/oic/sec/pstat" Resource is set to 2 (RFPRO).

When Device state is RFPRO:
– The "s" Property of the "dos" Property of the "/oic/sec/pstat" Resource is read-only by unauthorized requestors and read-write by authorized requestors.
– NCRs shall not be accessible, except for Easy Setup Resources, if supported.
– An authorized Client may provision SVRs as needed for normal functioning in RFNOP.
– An authorized Client may perform consistency checks on SVRs to determine which shall be re-provisioned.
– Failure to successfully provision SVRs may trigger a state change to RESET. For example, if the Device has already transitioned from SRESET but consistency checks continue to fail.
– The authorized Client sets the "s" Property of the "dos" Property of the "/oic/sec/pstat" Resource to 3 (RFNOP).

When Device state is RFNOP:
– The "s" Property of the "dos" Property of the "/oic/sec/pstat" Resource is read-only by unauthorized requestors and read-write by authorized requestors.
– NCRs, SVRs and core Resources are accessible following normal access processing.
– When additional provisioning is necessary, the Device may be transitioned to RFPRO by an authorized Client. Only the Device owner should transition to SRESET or RESET.

When Device state is SRESET:
– NCRs shall not be accessible. The integrity of NCRs may be suspect but the SRM doesn’t attempt to access or reference them.
– SVR integrity is not guaranteed, but access to some SVR Properties is necessary. These include "devowneruuid" Property of the "/oic/sec/doxm" Resource, "creds":[...,"subjectuuid":<devowneruuid>],...]} Property of the "/oic/sec/cred" Resource and "pstat.dos.s" "/oic/sec/pstat" Resource.
– The certificates that identify and authorize the Device owner are sufficient to re-create minimalist "/oic/sec/cred" and "/oic/sec/doxm" Resources enabling Device owner control of SRESET. If the SRM can’t establish these Resources, then it will transition to RESET state.
– An authorized Client performs SVR consistency checks. The authorized Client can provision SVRs as needed to ensure they are available for continued provisioning in RFPRO or for normal functioning in RFNOP.
– The authorized Device owner can avoid entering RESET state and RFOTM by UPDATING "pstat.dos.s" with RFPRO or RFNOP values.

Copyright Open Connectivity Foundation, Inc. © 2016-2020. All rights Reserved
ACLS on SVR are presumed to be invalid. Access authorization is granted according to Device owner privileges only.

The SRM asserts a Client-directed operational mode (e.g. "/pstat.om"=4).

The provisioning mode type is a 16-bit mask enumerating the various Device provisioning modes. "{ProvisioningMode}" should be used in this document to refer to an instance of a provisioning mode without selecting any particular value.

"oic.sec.dpmtype" is defined in Table 39.

### 13.9 Certificate Signing Request Resource

The "/oic/sec/csr" Resource is used by a Device to provide its desired identity, public key to be certified, and a proof of possession of the corresponding private key in the form of a IETF RFC 2986 PKCS#10 Certification Request. If the Device supports certificates (i.e. the "sct" Property of "/oic/sec/doxm" Resource has a 1 in the 0x8 bit position), the Device shall have a "/oic/sec/csr" Resource.

"/oic/sec/csr" Resource is defined in Table 44.

### Table 44 – Definition of the "/oic/sec/csr" Resource

<table>
<thead>
<tr>
<th>Fixed URI</th>
<th>Resource Type Title</th>
<th>Resource Type ID (&quot;rt&quot; value)</th>

<td>R</td>
<td>Yes</td>
<td>A string specifying the encoding format of the data contained in the csr Property &quot;oic.sec.encoding.pem&quot; – Encoding for PEM-encoded certificate signing request</td>
</tr>
</tbody>
</table>

The Device chooses which public key to use, and may optionally generate a new key pair for this purpose.

In the CSR, the Common Name component of the Subject Name shall contain a string of the format "uuid:X" where X is the Device’s requested UUID in the format defined by IETF RFC 4122. The Common Name, and other components of the Subject Name, may contain other data. If the Device chooses to include additional information in the Common Name component, it shall delimit it from the UUID field by white space, a comma, or a semicolon.
If the Device does not have a pre-provisioned key pair to use, but is capable and willing to generate a new key pair, the Device may begin generation of a key pair as a result of a RETRIEVE of this resource. If the Device cannot immediately respond to the RETRIEVE request due to time required to generate a key pair, the Device shall return an "operation pending" error. This indicates to the Client that the Device is not yet ready to respond, but will be able at a later time. The Client should retry the request after a short delay.

13.10 Roles Resource

The "roles" Resource maintains roles that have been asserted with role certificates, as described in clause 10.4.2. Asserted roles have an associated public key, i.e., the public key in the role certificate. Servers shall only grant access to the roles information associated with the public key of the Client. The roles Resource should be viewed as an extension of the (D)TLS session state. See 10.4.2 for how role certificates are validated.

The roles Resource shall be created by the Server upon establishment of a secure (D)TLS session with a Client, if it is not already created. The roles Resource shall only expose a secured OCF Endpoint in the "/oic/res" response. A Server shall retain the roles Resource at least as long as the (D)TLS session exists. A Server shall retain each certificate in the roles Resource at least until the certificate expires or the (D)TLS session ends, whichever is sooner. The requirements of clause 10.3 and 10.4.2 to validate a certificate's time validity at the point of use always apply. A Server should regularly inspect the contents of the roles resource and purge contents based on a policy it determines based on its resource constraints. For example, expired certificates, and certificates from Clients that have not been heard from for some arbitrary period of time could be candidates for purging.

The OCF namespace ("oic.role.*") is restricted to OCF-defined roles. "oic.role.owner" is an OCF-defined Role that is intended to provide Resource Owner privileges to multiple Clients in a scalable way. Servers shall grant access to perform all supported operations in the current Device state (see clause 8) on all supported SVRs regardless of ACL configuration the Clients asserting "oic.role.owner" Role. Servers shall reject assertion of any Role, which starts with "oic.role.", but is not one of the following Roles:

- "oic.role.owner"

The "roles" Resource is implicitly created by the Server upon establishment of a (D)TLS session. In more detail, the RETRIEVE, UPDATE and DELETE operations on the roles Resource shall behave as follows. Unlisted operations are implementation specific and not reliable.

1) A RETRIEVE request shall return all previously asserted roles associated with the currently connected and authenticated Client’s identity. RETRIEVE requests with a "credid" query parameter is not supported; all previously asserted roles associated with the currently connected and authenticated Client’s identity are returned.

2) An UPDATE request that includes the "roles" Property shall replace or add to the Properties included in the array as follows:

a) If either the "publicdata" or the "optionaldata" are different than the existing entries in the "roles" array, the entry shall be added to the "roles" array with a new, unique "credid" value.

b) If both the "publicdata" and the "optionaldata" match an existing entry in the "roles" array, the entry shall be considered to be the same. The Server shall reply with a 2.04 Changed response and a duplicate entry shall not be added to the array.

c) The "credid" Property is optional in an UPDATE request and if included, it may be ignored by the Server. The Server shall assign a unique "credid" value for every entry of the "roles" array.
3) A DELETE request without a "credid" query parameter shall remove all entries from the "/oic/sec/roles" resource array corresponding to the currently connected and authenticated 
Client’s identity.

4) A DELETE request with a "credid" query parameter shall remove only the entries of the "/oic/sec/roles" resource array corresponding to the currently connected and authenticated 
Client’s identity and where the corresponding "credid" matches the entry.

NOTE The "/oic/sec/roles" Resource’s use of the DELETE operation is not in accordance with the OCF Interfaces 

See clause 8 for restrictions on the states in which this Resource may be modified.

"/oic/sec/roles" Resource is defined in Table 46.

<table>
<thead>
<tr>
<th>Fixed URI</th>
<th>Resource Title</th>
<th>Resource Type ID (&quot;rt&quot; value)</th>
<th>OCF Interfaces</th>
<th>Description</th>
<th>Related Functional Interaction</th>
</tr>
</thead>
<tbody>
<tr>
<td>/oic/sec/roles</td>
<td>Roles</td>
<td>oic.r.roles</td>
<td>oic.if.base, oic.if.rw</td>
<td>Resource containing roles that have previously been asserted to this Server</td>
<td>Security</td>
</tr>
</tbody>
</table>

Table 47 defines the Properties of "/oic/sec/roles".

<table>
<thead>
<tr>
<th>Property Title</th>
<th>Property Name</th>
<th>Value Type</th>
<th>Value Rule</th>
<th>Access Mode</th>

</thead>
<tbody>
<tr>
<td>Roles</td>
<td>roles</td>
<td>oic.sec.cred</td>
<td>array</td>
<td>RW</td>
<td>Yes</td>
<td>List of roles previously asserted to this Server</td>
</tr>
</tbody>
</table>

Because "/oic/sec/roles" shares the "oic.sec.cred" schema with "/oic/sec/cred", "subjectuuid" is a required Property.
However, "subjectuuid" is not used in a role certificate. Therefore, a Device may ignore the "subjectuuid" Property if the Property is contained in an UPDATE request to the "/oic/sec/roles" Resource.

13.11 Auditable Events List Resource

13.11.1 Auditable Events List Resource General

The "/oic/sec/ael" Resource maintains a list of logged Auditable Events. Every OCF Device logs AEEs filtered according to the values of the "categoryfilter" and "priorityfilter" Properties of "/oic/sec/ael" Resource. All Devices shall have a "/oic/sec/ael" Resource to maintain AEEs. The new AEE shall be added to the "events" Property of "/oic/sec/ael" Resource as the last entry in the array. A Device shall store all AEEs of the "/oic/sec/ael" Resource in non-volatile memory. A Device shall be able to store at least 1 AEE.

The "categoryfilter" Property determines what categories of AEEs are to be logged. The "categoryfilter" Property is an integer value which is a composition of bitmasks. A Device shall log all AEEs filtered by this value. If the "categoryfilter" is either set to 0xff or is not set, then the Device shall log AEEs of all categories. Refer to Table 49 for more details.

The "priorityfilter" Property determines the lowest priority of AEE to be logged. A smaller value means higher priority. The AEEs whose "priority" Property values are equal to or smaller than this value shall be logged. If the "priorityfilter" Property is either set to the highest priority or is not set, then the Device shall log all AEEs. No matter what value is set to "priorityfilter", an AEE of CRIT (== 0) "priority" shall always be logged. Refer to Table 49 for more details.

When an AEE is added, the "usedspace" Property shall be updated to reflect the total storage used by all logged events. When the reserved storage for AEEs is full, the oldest AEE shall be purged.

A Device logs a new AEE as follows:
5) If a new AEE is not filtered by "categoryfilter" and "priorityfilter", then it is dropped.

/* c-like pseudo code */
If ((categoryfilter & new_aee->category) && (priorityfilter >= new_aee->priority))
{
    addAEE(new_aee);
}
else
{
    free(new_aee);
}

6) If the value of "usedspace" Property is equal to, or the sum of the "usedspace" Property value and the size of the new AEE is bigger than the value of the "maxspace" Property of "/oic/sec/ael" Resource, then:
   a) Remove the oldest AEE continuously while the sum of the "usedspace" Property value and the size of the new AEE is bigger than the "maxspace" Property value.
   /* c-like pseudo code */
   Int addAEE(AEEtype *new_aee)
   {
       While ((usespace + new_aee->size) > maxspace)
       {
           /* purgeAEE() returns the size of purged AEE */
           sizeOfPurgedAEE = purgeAEE();
           usedspace -= sizeOfPurgedAEE;
       }
       ...
       ...
   }

7) Add the new AEE to the "events" array Property of the "/oic/sec/ael" Resource as the last entry in the array.

8) Increase the value of the "usedspace" Property by the size of the new AEE.

In order to provide a mechanism which allows management of the "events" array Property, the RETRIEVE and UPDATE operations on the "/oic/sec/ael" Resource shall behave as follows:

9) A RETRIEVE operation shall return the full Resource representation.

10) An UPDATE operation may set the "categoryfilter" and/or "priorityfilter" Properties.

The "/oic/sec/ael" Resource is defined in Table 48.

Table 48 – Definition of the "/oic/sec/ael" Resource

</tr>
</tbody>
</table>
logged. A smaller value means a higher priority.

Meaning of each value:

- 0 (CRIT)
- 1 (ERR)
- 2 (WARN)
- 3 (INFO)
- 4 (DEBUG)

E.g.: if "priorityfilter" is set to DEBUG (==4) all AEEs will be logged.
E.g.: if "priorityfilter" is set to 1, CRIT (==0) and ERR (==1) SEEs will be logged.

Table 50 defines the Properties of the "oic.sec.aee" type.

OCF-defined AEEs are listed in Table 52, and each such AEE has its own values for the "category" and "priority" Properties.
The "timestamp" Property follows a full-date and partial-time format of RFC3339. Every new AEE shall have a later timestamp than the latest previously logged AEE.

The "auxiliaryinfo" Property provides supplementary info which is not covered by the description in "message" Property. For example, the URI of specific Resource in ACE2 could be "auxiliaryinfo" for "Access Denied" AEE. Please see Table 52 "List of Auditable Events".

13.12 Account Resource – moved to OCF Cloud Security Specification
This clause is intentionally left blank.

13.13 Account Session Resource – moved to OCF Cloud Security Specification
This clause is intentionally left blank.

This clause is intentionally left blank.

13.15 Security Virtual Resources (SVRs) and Access Policy
The SVRs expose the security-related Properties of the Device.

Granting access requests (RETRIEVE, UPDATE, DELETE, etc.) for these SVRs to unauthenticated (anonymous) Clients could create privacy or security concerns.

For example, when the Device onboarding State is RFOTM, it is necessary to grant requests for the "/oic/sec/doxm" Resource to anonymous requesters, so that the Device can be discovered and onboarded by an OBT. Subsequently, it might be preferable to deny requests for the "/oic/sec/doxm" Resource to anonymous requesters, to preserve privacy.

13.16 SVRs, Discoverability and OCF Endpoints
All implemented SVRs shall be "discoverable" (reference ISO/IEC 30118-1:2018, Policy Parameter clause 7.8.2.1.2).

All implemented discoverable SVRs shall expose a Secure OCF Endpoint (e.g. CoAPS) (reference ISO/IEC 30118-1:2018, clause 10).

The "/oic/sec/doxm" Resource shall expose an Unsecure OCF Endpoint (e.g. CoAP) in RFOTM (reference ISO/IEC 30118-1:2018, clause 10).

13.17 Additional Privacy Consideration for Core Resources
Unique immutable identifiers are a privacy consideration due to their potential for being used as a tracking mechanism. These include the following Resources and Properties:

- "/oic/d" Resource containing the "piid" Property.
- "/oic/p" Resource containing the "pi" Property.

These identifiers are unique values that are visible at various times throughout the Device lifecycle by anonymous requesters. This implies any Client Device, including those with malicious intent, are able to reliably obtain identifiers useful for building a log of activity correlated with a specific Platform and Device.

The "di" Property in the "/oic/d" Resource shall mirror that of the "deviceuuid" Property of the "/oic/sec/doxm" Resource. The DOTS should provision an ACL policy that restricts access to the "/oic/d" resource such that only authenticated Clients are able to obtain the "di" Property of "/oic/d" Resource. See clause 13.1 for deviceuuid Property lifecycle requirements.
Servers should expose a temporary, non-repeated, "piid" Property of "/oic/d" Resource Value upon entering RESET Device state. Servers shall expose a persistent value via the "piid" Property of "/oic/d" Property when the DOTS sets "devowneruuid" Property to a non-nil-UUID value. The DOTS should provision an ACL policy on the "/oic/d" Resource such that only authenticated Clients are able to obtain the "piid" Property of "/oic/d" Resource.

Servers should expose a temporary, non-repeated, "pi" Property value upon entering RESET Device state. Servers shall expose a persistent value via the "pi" Property of the "/oic/p" Resource when the DOTS sets "devowneruuid" Property to a non-nil-UUID value. The DOTS should provision an ACL policy on the "/oic/p" Resource such that only authenticated Clients are able to obtain the "pi" Property.

### 13.18 Easy Setup Resource Device State

This clause only applies to a new Device that uses Easy Setup for ownership transfer as defined in OCF Wi-Fi Easy Setup. Easy Setup has no impact to new Devices that have a different way of connecting to the network i.e. DOTS and AMS don't use a Soft AP to connect to non-Easy Setup Devices.

Figure 23 shows an example of Soft AP and Easy Setup Resource in different Device states.
Figure 23 – Example of Soft AP and Easy Setup Resource in different Device states

Device enters RFOTM Device state, Soft AP may be accessible in RFOTM and RFPRO Device’s state.

While it is reasonable for an End User to expect that power cycling a new Device will turn on the Soft AP for Easy Setup during the initial setup, since that is potentially how it behaved on first boot, it is a security risk to make this the default behaviour of a device that remains unenrolled beyond a reasonable period after first boot.

Therefore, the Soft AP for Easy Setup has several requirements to improve security:

- Time availability of Easy Setup Soft AP should be minimised, and shall not exceed 30 minutes after Device factory reset RESET or first power boot, or when an End User initiates the Soft AP for Easy Setup.

- If a new Device tried and failed to complete Easy Setup Enrolment immediately following the first boot, or after a factory reset, it may turn the Easy Setup Soft AP back on automatically for another 30 minutes upon being power cycled, provided that the power cycle occurs within 3 hours of first boot or the most recent factory reset. If the End User has initiated the Easy Setup Soft AP directly without a factory reset, it is not necessary to turn it back on if it was on immediately prior to power cycle, because the End User obviously knows how to initiate the process manually.

- After 3 hours from first boot or factory reset without successfully enrolling the device, the Soft AP should not turn back on for Easy Setup until another factory reset occurs, or the End User initiates the Easy Setup Soft AP directly.

- Easy Setup Soft AP may stay enabled during RFNOP, until the Mediator instructs the new Device to connect to the Enroller.

- The Easy Setup Soft AP shall be disabled when the new Device successfully connects to the Enroller.

- Once a new Device has successfully connected to the Enroller, it shall not turn the Easy Setup Soft AP back on for Easy Setup Enrolment again unless the Device is factory reset, or the End User initiates the Easy Setup Soft AP directly.

- Just Works OTM shall not be enabled on Devices which support Easy Setup.

- The Soft AP shall be secured (e.g. shall not expose an open AP).

Copyright Open Connectivity Foundation, Inc. © 2016-2020. All rights Reserved
The Soft AP shall support a passphrase for connection by the Mediator, and the passphrase shall be between 8 and 64 ASCII printable characters. The passphrase may be printed on a label, sticker, packaging etc., and may be entered by the End User into the Mediator device.

The Soft AP should not use a common passphrase across multiple Devices. Instead, the passphrase may be sufficiently unique per device, to prevent guessing of the passphrase by an attacker with knowledge of the Device type, model, manufacturer, or any other information discoverable through Device’s exposed interfaces.

The Enrollee shall support WPA2 security (i.e. shall list WPA2 in the "swat" Property of the "/example/WiFiConfResURI" Resource), for potential selection by the Mediator in connecting the Enrollee to the Enroller. The Mediator should select the best security available on the Enroller, for use in connecting the Enrollee to the Enroller.

The Enrollee may not expose any interfaces (e.g. web server, debug port, NCRs, etc.) over the Soft AP, other than SVRs, and Resources required for Wi-Fi Easy Setup.

The "/example/EasySetupResURI" Resource should not be discoverable in RFOTM or SRESET state. After ownership transfer process is completed with the DOTS, and the Device enters in RFPRO Device state, the "/example/EasySetupResURI" may be Discoverable.

The OTM CoAPS session may be used by Mediator for connection over Soft AP for ownership transfer and initial Easy Setup provisioning. SoftAP or regular network connection may be used by AMS for "/oic/sec/acl2" Resource provisioning in RFPRO state. The CoAPS session authentication and encryption is already defined in the Security spec.

In RFPRO state, AMS is expected to configure ACL2 Resource on the Device with ACE2 for following Resources to be only configurable by the Mediator with permission to UPDATE or RETRIEVE access:

- "/example/EasySetupResURI"
- "/example/WifiConfResURI"
- "/example/DevConfResURI"

An ACE2 granting RETRIEVE or UPDATE access to the Easy Setup Resource

```json
{
    "subject": { "uuid": "<insert-UUID-of-Mediator>" },
    "resources": [
        { "href": "/example/EasySetupResURI" },
        { "href": "/example/WiFiConfResURI" },
        { "href": "/example/DevConfResURI" }
    ],
    "permission": 6 // RETRIEVE (2) or UPDATE and RETRIEVE(6)
}
```

ACE2 may be re-configured after Easy Setup process. These ACE2s should be installed prior to the Mediator performing any RETRIEVE/UPDATE operations on these Resources.

In RFPRO or RFNOP, the Mediator should discover /EasySetupResURI Resources and UPDATE these Resources. The Mediator may UPDATE /EasySetupResURI resources in RFNOP Device state.

A Mediator shall be hosted on an OCF Device.
13.19 List of Auditable Events

Whenever a Device detects an occurrence of any of the Auditable Events in Table 52, then the Device shall log an AEE using the corresponding "category", "priority" and "auxiliaryinfo" Properties defined in Table 52. The "auxiliaryinfo" Property shall contain the entries in the "auxiliaryinfo" column of Table 52 in the order specified in the table with each bullet contained in a separate array entry. The "auxiliaryinfo" Property may contain additional entries for further information following the entries for mandatory information. The "aeid" Property shall include the corresponding Auditable Event Identifier from Table 52.

Table 52 – List of mandatory Auditable Events and corresponding Property values

<table>
<thead>
<tr>
<th>Auditable Event Identifier (&quot;aeid&quot;)</th>
<th>Auditable Event Description</th>
<th>Example &quot;message&quot;</th>
<th>&quot;category&quot;</th>
<th>&quot;priority&quot;</th>
<th>&quot;auxiliaryinfo&quot;</th>
</tr>
</thead>
</table>
| AC-1                                | A Device received a request from an authenticated Client with valid URI path, valid interface and valid operation for that resource, but for which access was denied. | "Access Denied" | 0x01 (Access Control) | 2 (WARN) | • Client IP address & port in format [xxxx:...:xxxx]:xxxx  
• Client UUID in UUID format (e.g. "00000000-0000-0000-0000-000000000000")  
• Resource URI (e.g. "oic/sec/acl")  
• Requested CRUDN operation (e.g. "CREATE")  
• Server security state (e.g. "RFNOP")  
• Asserted roles by Client (e.g. "oic.role.owner"), or "No roles asserted" if there are none |
| AUTH-1                              | The Device encountered an error during a DTLS handshaking procedure due to a credential validation failure. | "DTLS handshake failed due to a credential validation failure" | 0x08 (Authentication) | 1 (ERR) | • Client IP address & port in format [xxxx:...:xxxx]:xxxx |
| COMM-1                              | The Device received a CoAP request which contained unexpected/unsupported CoAP header parameters or unexpected/unsupported CoAP options. | "Unexpected CoAP Command" | 0x40 (COMM) | 2 (WARN) | • Client IP address & port in format [xxxx:...:xxxx]:xxxx  
• Hex-encoded CoAP header in format [xx:xx:xx:xx]  
• Hex-encoded CoAP options except payload (empty if not present) |

Whenever a Device detects an occurrence of any of the Auditable Events in Table 53, then the Device should log an AEE using the corresponding "category", "priority" and "auxiliaryinfo" Properties defined in Table 53. The "auxiliaryinfo" Property shall contain the entries in the "auxiliaryinfo" column of Table 53 in the order specified in the table with each bullet contained in a separate array entry. The "auxiliaryinfo" Property may contain additional entries for further information following the entries for mandatory information. The "aeid" Property shall include the corresponding Auditable Event Identifier from Table 53.

</tbody>
</table>
The "/oic/sec/sdi" Resource contains the information that identifies the OCF Security Domain to which the Device belongs. OCF Security Domains are uniquely identifiable.

This Resource is optional to implement. When it is exposed by a Device, an OCF Onboarding Tool (OBT) is expected to provision a random UUID and a Security Domain Name for the OCF Security Domain. These two fields are provisioned to a Device during the onboarding process.

"oic.r.sdi" Resource Type is defined in Table 54.

### Table 54 – Definition of the "oic.r.sdi" Resource Type

The purpose of the "priv" Property is to control whether information about a Device’s OCF Security Domain is exposed during multicast discoveries.

If the "priv" Property is set to "false", then the "/oic/res" Resource shall expose its "sduuid" and "sdname" Properties with values copied from the "uuid" and "name" Properties of the "/oic/sec/sdi" Resource, respectively.

If the "priv" Property is set to "true", then the "/oic/res" Resource shall not expose its "sduuid" and "sdname" Properties.
14 Security Hardening Guidelines/ Execution Environment Security

14.1 Preamble

This is an informative clause. Many TGs in OCF have security considerations for their protocols and environments. These security considerations are addressed through security mechanisms specified in the security documents for OCF. However, effectiveness of these mechanisms depends on security robustness of the underlying hardware and software Platform. This clause defines the components required for execution environment security.

14.2 Execution Environment Elements

14.2.1 Execution Environment Elements General

Execution environment within a computing Device has many components. To perform security functions in a robustness manner, each of these components has to be secured as a separate dimension. For instance, an execution environment performing AES cannot be considered secure if the input path entering keys into the execution engine is not secured, even though the partitions of the CPU, performing the AES encryption, operate in isolation from other processes. Different dimensions referred to as elements of the execution environment are listed below. To qualify as a secure execution environment (SEE), the corresponding SEE element must qualify as secure.

- (Secure) Storage
- (Secure) Execution engine
- (Trusted) Input/output paths
- (Secure) Time Source/clock
- (Random) number generator
- (Approved) cryptographic algorithms
- Hardware Tamper (protection)

NOTE Software security practices (such as those covered by OWASP) are outside scope of this document, as development of secure code is a practice to be followed by the open source development community. This document will however address the underlying Platform assistance required for executing software. Examples are secure boot and secure software upgrade.

Each of the elements above are described in the clauses 14.2.2, 14.2.3, 14.2.4, 14.2.5, 14.2.6, 14.2.7.

14.2.2 Secure Storage

14.2.2.1 Secure Storage General

Secure storage refers to the physical method of housing sensitive or confidential data ("Sensitive Data"). Such data could include but not be limited to symmetric or asymmetric private keys, certificate data, OCF Security Domain access credentials, or personal user information. Sensitive Data requires that its integrity be maintained, whereas Critical Sensitive Data requires that both its integrity and confidentiality be maintained.

It is strongly recommended that IoT Device makers provide reasonable protection for Sensitive Data so that it cannot be accessed by unauthorized Devices, groups or individuals for either malicious or benign purposes. In addition, since Sensitive Data is often used for authentication and encryption, it must maintain its integrity against intentional or accidental alteration.

A partial list of Sensitive Data is outlined in Table 56:
Table 56 – Examples of Sensitive Data

<table>
<thead>
<tr>
<th>Data</th>
<th>Integrity protection</th>
<th>Confidentiality protection</th>
</tr>
</thead>
<tbody>
<tr>
<td>Owner PSK (Symmetric Keys)</td>

<td>Yes</td>
</tr>
<tr>
<td>Access Token</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Exact method of protection for secure storage is implementation specific, but typically combinations of hardware and software methods are used.

14.2.2.2 Hardware Secure Storage

Hardware secure storage is recommended for use with critical Sensitive Data such as symmetric and asymmetric private keys, access credentials, and personal private data. Hardware secure storage most often involves semiconductor-based non-volatile memory ("NVRAM") and includes countermeasures for protecting against unauthorized access to Critical Sensitive Data.

Hardware-based secure storage not only stores Sensitive Data in NVRAM, but also provides protection mechanisms to prevent the retrieval of Sensitive Data through physical and/or electronic attacks. It is not necessary to prevent the attacks themselves, but an attempted attack should not result in an unauthorized entity successfully retrieving Sensitive Data.

Protection mechanisms should provide JIL Moderate protection against access to Sensitive Data from attacks that include but are not limited to:

1) Physical decapping of chip packages to optically read NVRAM contents
2) Physical probing of decapped chip packages to electronically read NVRAM contents
3) Probing of power lines or RF emissions to monitor voltage fluctuations to discern the bit patterns of Critical Sensitive Data
4) Use of malicious software or firmware to read memory contents at rest or in transit within a microcontroller
5) Injection of faults that induce improper Device operation or loss or alteration of Sensitive Data

14.2.2.3 Software Storage

It is generally NOT recommended to rely solely on software and unsecured memory to store Sensitive Data even if it is encrypted. Critical Sensitive Data such as authentication and encryption keys should be housed in hardware secure storage whenever possible.
Sensitive Data stored in volatile and non-volatile memory shall be encrypted using acceptable algorithms to prevent access by unauthorized parties through methods described in 14.2.2.2.

14.2.2.4 Additional Security Guidelines and Best Practices

Some general practices that can help ensure that Sensitive Data is not compromised by various forms of security attacks:

1) FIPS Random Number Generator ("RNG") – Insufficient randomness or entropy in the RNG used for authentication challenges can substantially degrade security strength. For this reason, it is recommended that a FIPS 800-90A-compliant RNG with a certified noise source be used for all authentication challenges.

2) Secure download and boot – To prevent the loading and execution of malicious software, where it is practical, it is recommended that Secure Download and Secure Boot methods that authenticate a binary’s source as well as its contents be used.

3) Deprecated algorithms – Algorithms included but not limited to the list below are considered unsecure and shall not be used for any security-related function:
   a) SHA-1
   b) MD5
   c) RC4
   d) RSA 1024

4) Encrypted transmission between blocks or components – Even if critical Sensitive Data is stored in Secure Storage, any use of that data that requires its transmission out of that Secure Storage should be encrypted to prevent eavesdropping by malicious software within an MCU/MPU.

5) It is recommended to avoid using wildcard in Subject Id ("*"), when setting up "/oic/sec/cred" Resource entries, since this opens up an identity spoofing opportunity.

6) Device vendor understands that it is the Device vendor’s responsibility to ensure the Device meets security requirements for its intended uses. As an example, IoTivity is a reference implementation intended to be used as a basis for a product, but IoTivity has not undergone 3rd party security review, penetration testing, etc. Any Device based on IoTivity should undergo appropriate penetration testing and security review prior to sale or deployment.

7) Device vendor agrees to publish the expected support lifetime for the Device to OCF and to consumers. Changes should be made to a public and accessible website. Expectations should be clear as to what will be supported and for how long the Device vendor expects to support security updates to the software, operating system, drivers, networking, firmware and hardware of the device.

8) Device vendor has not implemented test or debug interfaces on the Device which are operable or which can be enabled which might present an attack vector on the Device which circumvents the interface-level security or access policies of the Device.

9) Device vendor understands that if an application running on the Device has access to cryptographic elements such as the private keys or Ownership Credential, then those elements have become vulnerable. If the Device vendor is implementing a Bridge, an OBT, or a Device with access to the Internet beyond the local network, the execution of critical functions should take place within a Trusted or Secure Execution Environment (TEE/SEE).

10) Any PINs or fixed passphrases used for onboarding, Wi-Fi Easy Setup, SoftAP management or access, or other security-critical function, should be sufficiently unique (do not duplicate passphrases. The creation of these passphrases or PINS should not be algorithmically deterministic nor should they use insufficient entropy in their creation.

11) Ensure that there are no remaining "VENDOR_TODO" items in the source code.
12) If the implementation of this document uses the "Just Works" onboarding method, understand that there is a man-in-the-middle vulnerability during the onboarding process where a malicious party could intercept messages between the device being onboarded and the OBT and could persist, acting as an intermediary with access to message traffic, during the lifetime of that onboarded device. The recommended best practice would be to use an alternate ownership transfer method (OTM) instead of "Just Works".

13) It is recommended that at least one static and dynamic analysis tool\(^1\) be applied to any proposed major production release of the software before its release, and any vulnerabilities resolved.

### 14.2.3 Secure execution engine

Execution engine is the part of computing Platform that processes security functions, such as cryptographic algorithms or security protocols (e.g. DTLS). Securing the execution engine requires the following:

- Isolation of execution of sensitive processes from unauthorized parties/processes. This includes isolation of CPU caches, and all of execution elements that needed to be considered as part of trusted (crypto) boundary.

- Isolation of data paths into and out of execution engine. For instance, both unencrypted but sensitive data prior to encryption or after decryption, or cryptographic keys used for cryptographic algorithms, such as decryption or signing. See clause 14.2.4 for more details.

### 14.2.4 Trusted input/output paths

Paths/ports used for data entry into or export out of trusted/crypto-boundary needs to be protected. This includes paths into and out secure execution engine and secure memory.

Path protection can be both hardware based (e.g. use of a privileged bus) or software based (using encryption over an untrusted bus).

### 14.2.5 Secure clock

Many security functions depend on time-sensitive credentials. Examples are time stamped Kerberos tickets, OAuth tokens, X.509 certificates, OSCP response, software upgrades, etc. Lack of secure source of clock can mean an attacker can modify the system clock and fool the validation mechanism. Thus an SEE needs to provide a secure source of time that is protected from tampering. Trustworthiness from security robustness standpoint is not the same as accuracy. Protocols such as NTP can provide rather accurate time sources from the network, but are not immune to attacks. A secure time source on the other hand can be off by seconds or minutes depending on the time-sensitivity of the corresponding security mechanism. Secure time source can be external as long as it is signed by a trusted source and the signature validation in the local Device is a trusted process (e.g. backed by Secure Boot).

### 14.2.6 Approved algorithms

An important aspect of security of the entire ecosystem is the robustness of publicly vetted and peer-reviewed (e.g. NIST-approved) cryptographic algorithms. Security is not achieved by obscurity of the cryptographic algorithm. To ensure both interoperability and security, not only widely accepted cryptographic algorithms must be used, but also a list of approved cryptographic functions must be specified explicitly. As new algorithms are NIST approved or old algorithms are deprecated, the list of approved algorithms must be maintained by OCF. All other algorithms (even if they deemed stronger by some parties) must be considered non-approved.

The set of algorithms to be considered for approval are algorithms for

- Hash functions

---

\(^1\) A general discussion of analysis tools can be found here: https://www.ibm.com/developerworks/library/se-static/
– Signature algorithms
– Encryption algorithms
– Key exchange algorithms
– Pseudo Random functions (PRF) used for key derivation

This list will be included in this or a separate security robustness rules document and must be followed for all security specifications within OCF.

### 14.2.7 Hardware tamper protection

Various levels of hardware tamper protection exist. We borrow FIPS 140-2 terminology (not requirements) regarding tamper protection for cryptographic module

– Production-grade (lowest level): this means components that include conformal sealing coating applied over the module’s circuitry to protect against environmental or other physical damage. This does not however require zeroization of secret material during physical maintenance. This definition is borrowed from FIPS 140-2 security level 1.

– Tamper evident/proof (mid-level), This means the Device shows evidence (through covers, enclosures, or seals) of an attempted physical tampering. This definition is borrowed from FIPS 140-2 security level 2.

– Tamper resistance (highest level), this means there is a response to physical tempering that typically includes zeroization of sensitive material on the module. This definition is borrowed from FIPS 140-2 security level 3.

It is difficult of specify quantitative certification test cases for accreditation of these levels. Content protection regimes usually talk about different tools (widely available, specialized and professional tools) used to circumvent the hardware protections put in place by manufacturing. If needed, OCF can follow that model, if and when OCF engage in distributing sensitive key material (e.g. PKI) to its members.

### 14.3 Secure Boot

#### 14.3.1 Concept of software module authentication

In order to ensure that all components of a Device are operating properly and have not been tampered with, it is best to ensure that the Device is booted properly. There may be multiple stages of boot. The end result is an application running on top an operating system that takes advantage of memory, CPU and peripherals through drivers.

The general concept is that each software module is invoked only after cryptographic integrity verification is complete. The integrity verification relies on the software module having been hashed (e.g. SHA_1, SHA_256) and then signed with a cryptographic signature algorithm with (e.g. RSA), with a key that only a signing authority has access to.

Figure 24 depicts software module authentication.
After the data is signed with the signer’s signing key (a private key), the verification key (the public key corresponding to the private signing key) is provided for later verification. For lower level software modules, such as bootloaders, the signatures and verification keys are inserted inside tamper proof memory, such as one-time programmable memory or TPM. For higher level software modules, such as application software, the signing is typically performed according to the PKCS#7 format IETF RFC 2315, where the signedData format includes both indications for signature algorithm, hash algorithm as well as the signature verification key (or certificate). Secure boot does not require use of PKCS#7 format.

Figure 25 depicts verification software module.

As shown in Figure 26 the verification module first decrypts the signature with the verification key (public key of the signer). The verification module also calculates a hash of the data and then compares the decrypted signature (the original) with the hash of data (actual) and if the two values match, the software module is authentic.
14.3.2 Secure Boot process

Depending on the Device implementation, there may be several boot stages. Typically, in a PC/Linux type environment, the first step is to find and run the BIOS code (first-stage bootloader) to find out where the boot code is and then run the boot code (second-stage boot loader). The second stage bootloader is typically the process that loads the operating system (Kernel) and transfers the execution to the where the Kernel code is. Once the Kernel starts, it may load external Kernel modules and drivers.

When performing a secure boot, it is required that the integrity of each boot loader is verified before executing the boot loader stage. As mentioned, while the signature and verification key for the lowest level bootloader is typically stored in tamper-proof memory, the signature and verification key for higher levels should be embedded (but attached in an easily accessible manner) in the data structures software.

14.3.3 Robustness Requirements

14.3.3.1 Robustness General

To qualify as high robustness secure boot process, the signature and hash algorithms shall be one of the approved algorithms, the signature values and the keys used for verification shall be stored in secure storage and the algorithms shall run inside a secure execution environment and the keys shall be provided the SEE over trusted path.

14.3.3.2 Next steps

Develop a list of approved algorithms and data formats

14.4 Attestation

14.5 Software Update

14.5.1 Overview

The Device lifecycle does not end at the point when a Device is shipped from the manufacturer; the distribution, retailing, purchase, installation/onboarding, regular operation, maintenance and end-of-life stages for the Device remain outstanding. It is possible for the Device to require update...
during any of these stages, although the most likely times are during onboarding, regular operation and maintenance. The manufacturer shall have a defined policy available to OCF Security Domain Owner (e.g. via a website link) covering handling of any device vulnerabilities, including the software update information (e.g. if and how such updates are provided). This policy shall also cover any post end-of-life or end-of-service vulnerabilities. The aspects of the software include, but are not limited to, firmware, operating system, networking stack, application code, drivers, etc.

14.5.2 Recognition of Current Differences

Different manufacturers approach software update utilizing a collection of tools and strategies: over-the-air or wired USB connections, full or partial replacement of existing software, signed and verified code, attestation of the delivery package, verification of the source of the code, package structures for the software, etc.

It is recommended that manufacturers review their processes and technologies for compliance with industry best-practices that a thorough security review of these takes place and that periodic review continue after the initial architecture has been established.

This document applies to software updates as recommended to be implemented by OCF Devices; it does not have any bearing on the above-mentioned alternative proprietary software update mechanisms. The described steps are being triggered by an OCF Client, the actual implementation of the steps and how the software package is downloaded and upgraded is vendor specific.

The triggers that can be invoked from OCF clients can perform:

1) Check if new software is available
2) Download and verify the integrity of the software package
3) Install the verified software package

The triggers are not sequenced, each trigger can be invoked individually.

The state of the transitions of software update is in Figure 27.

```
Figure 27 – State transitioning diagram for software download
```

<table>
<thead>

<td>Upgrading</td>
</tr>
</tbody>
</table>

Table 57 – Description of the software update bits
14.5.2.1 Checking availability of new software

Setting the Initiate Software Availability Check bit in the "/oic/sec/pstat.tm" Property (see Table 37 of clause 13.8) indicates a request to initiate the process to check if new software is available, e.g. the process whereby the Device checks if a newer software version is available on the external endpoint. Once the Device has determined if an newer software version is available, it sets the Initiate Software Availability Check bit in the "/oic/sec/pstat.cm" Property to 1 (TRUE), indicating that new software is available or to 0 (FALSE) if no newer software version is available. See also Table 57 where the bits in property TM indicates that the action is initiated and the CM bits are indicating the result of the action. The Device receiving this trigger is not downloading and not validating the software to determine if new software is available. The version check is determined by the current software version and the software version on the external endpoint. The determination if a software package is newer is vendor defined.

14.5.3 Software Version Validation

Setting the Initiate Software Version Validation bit in the "/oic/sec/pstat.tm" Property (see Table 37 of 13.8) indicates a request to initiate the software version validation process, the process whereby the Device validates the software (including firmware, operating system, Device drivers, networking stack, etc.) against a trusted source to see if, at the conclusion of the check, the software update process will need to be triggered (see clause 14.5.4). When the Initiate Software Version Validation bit of "/oic/sec/pstat.tm" is set to 1 (TRUE) by a sufficiently privileged Client, the Device sets the "/oic/sec/pstat.cm" Initiate Software Version Validation bit to 0 and initiates a software version check. Once the Device has determined if a valid software is available, it sets the Initiate Software Version Validation bit in the "/oic/sec/pstat.cm" Property to 1 (TRUE) if an update is available or 0 (FALSE) if no update is available. To signal completion of the Software Version Validation process, the Device sets the Initiate Software Version Validation bit in the "/oic/sec/pstat.cm" Property back to 0 (FALSE). If the Initiate Software Version Validation bit of "/oic/sec/pstat.tm" is set to 0 (FALSE) by a Client, it has no effect on the validation process. The Software Version Validation process can download the software from the external endpoint to verify the integrity of the software package.

14.5.4 Software Update

The software of a Device shall be updatable.

Setting the Initiate Secure Software Update bit in the "/oic/sec/pstat.tm" Property (see Table 37 of clause 13.8) indicates a request to initiate the software update process. When the Initiate Secure Software Update bit of "/oic/sec/pstat.tm" is set to 1 (TRUE) by a sufficiently privileged Client, the Device sets the "/oic/sec/pstat.cm" Initiate Software Version Validation bit to 0 and initiates a software update process. Once the Device has completed the software update process, it sets the Initiate Secure Software Update bit in the "/oic/sec/pstat.cm" Property to 1 (TRUE) if/when the software was successfully updated or 0 (FALSE) if no update was performed. To signal completion of the Secure Software Update process, the Device sets the Initiate Secure Software Update bit in the "/oic/sec/pstat.tm" Property back to 0 (FALSE). If the Initiate Secure Software Update bit of "/oic/sec/pstat.tm" is set to 0 (FALSE) by a Client, it has no effect on the update process.

14.5.4.1 State of Device after software update

The state of all resources implemented in the Device should be the same as after boot, meaning that the software update is not resetting user data and retaining a correct state.

User data of a Device is defined as:

- Retain the SVR states, e.g. the on boarded state, registered clients.
- Retain all created resources
- Retain all stored data of a resource
  - For example the preferences stored for the brewing resource ("oic.r.brewing").
14.5.5  Recommended Usage

The Initiate Secure Software Update bit of "/oic/sec/pstat.tm" should only be set by a Client after the Initiate Software Version Validation check is complete.

The process of updating Device software may involve state changes that affect the Device Operational State ("/oic/sec/pstat.dos"). Devices with an interest in the Device(s) being updated should monitor "/oic/sec/pstat.dos" and be prepared for pending software update(s) to affect Device state(s) prior to completion of the update.

The Device itself may indicate that it is autonomously initiating a software version check/update or that a check/update is complete by setting the "pstat.tm" and "pstat.cm" Initiate Software Version Validation and Secure Software Update bits when starting or completing the version check or update process. As is the case with a Client-initiated update, Clients can be notified that an autonomous version check or software update is pending and/or complete by observing pstat resource changes.

The "oic.r.softwareupdate" Resource Type specifies additional features to control the software update process see core specification.

14.6  Non-OCF Endpoint interoperability

14.7  Security Levels

Security Levels are a way to differentiate Devices based on their security criteria. This need for differentiation is based on the requirements from different verticals such as industrial and health care and may extend into smart home. This differentiation is distinct from Device classification (e.g. IETF RFC 7228)

These categories of security differentiation may include, but is not limited to:

1) Security Hardening
2) Identity Attestation
3) Certificate/Trust
4) Onboarding Technique
5) Regulatory Compliance
   a) Data at rest
   b) Data in transit
6) Cipher Suites – Crypto Algorithms & Curves
7) Key Length
8) Secure Boot/Update

In the future security levels can be used to define interoperability.

The following applies to the OCF Security Specification 1.1:

The current document does not define any other level beyond Security Level 0. All Devices will be designated as Level 0. Future versions may define additional levels.

Additional comments:

- The definition of a given security level will remain unchanged between versions of the document.
- Devices that meet a given level may, or may not, be capable of upgrading to a higher level.
- Devices may be evaluated and re-classified at a higher level if it meets the requirements of the higher level (e.g. if a Device is manufactured under the 1.1 version of the document, and a later
document version defines a security level 1, the Device could be evaluated and classified as level 1 if it meets level 1 requirements).

– The security levels may need to be visible to the End User.

14.8 Security Profiles

14.8.1 Security Profiles General

Security Profiles are a way to differentiate OCF Devices based on their security criteria. This need for differentiation is based on the requirements from different verticals such as industrial and healthcare and may extend into smart home. This differentiation is distinct from device classification (e.g. IETF RFC 7228)

These categories of security differentiation may include, but is not limited to:

1) Security Hardening and assurances criteria
2) Identity Attestation
3) Certificate/Trust
4) Onboarding Technique
5) Regulatory Compliance
   a) Data at rest
   b) Data in transit
6) Cipher Suites – Crypto Algorithms & Curves
7) Key Length
8) Secure Boot/Update

Each Security Profile definition must specify the version or versions of the OCF Security Specification(s) that form a baseline set of normative requirements. The profile definition may include security requirements that supersede baseline requirements (not to relax security requirements).

Security Profiles have the following properties:

– A given profile definition is not specific to the version of the document that defines it. For example, the profile may remain constant for subsequent OCF Security Specification versions.
– A specific OCF Device and platform combination may be used to satisfy the security profile.
– Profiles may have overlapping criteria; hence it may be possible to satisfy multiple profiles simultaneously.
– An OCF Device that satisfied a profile initially may be re-evaluated at a later time and found to satisfy a different profile (e.g. if a device is manufactured under the 1.1 version of the document, and a later document version defines a security profile Black, the device could be evaluated and classified as profile Black if it meets profile Black requirements).
– A machine-readable representation of compliance results specifically describing profiles satisfied may be used to facilitate OCF Device onboarding. (e.g. a manufacturer certificate or manifest may contain security profiles attributes).

14.8.2 Identification of Security Profiles (Normative)

14.8.2.1 Security Profiles in Prior Documents

OCF Devices conforming to versions of the OCF Security Specifications where Security Profiles Resource was not defined may be presumed to satisfy the "sp-baseline-v0" profile (defined in 14.8.3.3) or may be regarded as unspecified. If Security Profile is unspecified, the Client may use the OCF Security Specification version to characterize expected security behaviour.
14.8.2.2 Security Profile Resource Definition

The "/oic/sec/sp" Resource is used by the OCF Device to show which OCF Security Profiles the OCF Device is capable of supporting and which are authorized for use by the OCF Security Domain owner. Properties of the Resource identify which OCF Security Profile is currently operational. The ocfSecurityProfileOID value type shall represent OID values and may reference an entry in the form of strings (UTF-8).

"/oic/sec/sp" Resource is defined in Table 58.

Table 58 – Definition of the "/oic/sec/sp" Resource

<table>
<thead>
<tr>
<th>Fixed URI</th>

</tr>
</tbody>
</table>

The following OIDs are defined to uniquely identify Security Profiles. Future Security Profiles or changes to existing Security Profiles may result in a new ocfSecurityProfileOID.

id-OCF OBJECT IDENTIFIER ::= { iso(1) identified-organization(3) dod(6) internet(1) private(4) enterprise(1) OCF(51414) }

id-ocfSecurity OBJECT IDENTIFIER ::= { id-OCF 0 }

id-ocfSecurityProfile ::= { id-ocfSecurity 0 }

sp-unspecified ::= OBJECT IDENTIFIER { id-ocfSecurityProfile 0 } --The Security Profile is not specified
sp-baseline ::= OBJECT IDENTIFIER { id-ocfSecurityProfile 1 } --This specifies the OCF Baseline Security Profile(s)
sp-black ::= OBJECT IDENTIFIER { id-ocfSecurityProfile 2 } --This specifies the OCF Black Security Profile(s)
sp-blue ::= OBJECT IDENTIFIER { id-ocfSecurityProfile 3 } --This specifies the OCF Blue Security Profile(s)
sp-purple ::= OBJECT IDENTIFIER { id-ocfSecurityProfile 4 } --This specifies the OCF Purple Security Profile(s)

--versioned Security Profiles
sp-unspecified-v0 ::= ocfSecurityProfileOID {id-sp-unspecified 0} --v0 of unspecified security profile, "1.3.6.1.4.1.51414.0.0.0.0"
sp-baseline-v0 ::= ocfSecurityProfileOID {id-sp-baseline 0} --v0 of baseline security profile, "1.3.6.1.4.1.51414.0.0.1.0"
sp-black-v0 ::= ocfSecurityProfileOID {id-sp-black 0} --v0 of black security profile, "1.3.6.1.4.1.51414.0.0.2.0"
sp-blue-v0 ::= ocfSecurityProfileOID {id-sp-blue 0} --v0 of blue security profile, "1.3.6.1.4.1.51414.0.0.3.0"
14.8.3 Security Profiles

14.8.3.1 Security Profiles General

The Security Profiles Resource shall be pre-populated with manufacturer default values (Refer to the Security Profile clauses for additional details).

The OCF Conformance criteria may require vendor attestation that establishes the expected environment in which the OCF Device is hosted (Refer to the Security Profile clauses for specific requirements).

14.8.3.2 Security Profile Unspecified (sp-unspecified-v0)

The Security Profile "sp-unspecified-v0" is reserved for future use.

14.8.3.3 Security Profile Baseline v0 (sp-baseline-v0)

The Security Profile "sp-baseline-v0" is defined for all OCF Security Specification versions where the "/oic/sec/sp" Resource is defined. All Devices shall include the "sp-baseline-v0" OID in the "supportedprofiles" Property of the "/oic/sec/sp" Resource.

It indicates the OCF Device satisfies the normative security requirements for this document.

When a device supports the baseline profile, the "supportedprofiles" Property shall contain sp-baseline-v0, represented by the OID string "1.3.6.1.4.1.51414.0.0.1.0", and may contain other profiles.

When a manufacturer makes sp-baseline-v0 the default, by setting the "currentprofile" Property to "1.3.6.1.4.1.51414.0.0.1.0", the "supportedprofiles" Property shall contain sp-baseline-v0.

14.8.3.4 Security Profile Black (sp-black-v0)

14.8.3.4.1 Black Profile General

The need for Security Profile Black v0 is to support devices and manufacturers who wish to certify their devices meeting this specific set of security criteria. A Device may satisfy the Black requirements as well as requirements of other profiles, the Black Security Profile is not necessarily mutually exclusive with other Security Profiles unless those requirements conflict with the explicit requirements of the Black Security Profile.

14.8.3.4.2 Devices Targeted for Security Profile Black v0

Security Profile Black devices could include any device a manufacturer wishes to certify at this profile, but healthcare devices and industrial devices with additional security requirements are the initial target. Additionally, manufacturers of devices at the edge of the network (or fog), or devices with exceptional profiles of trust bestowed upon them, may wish to certify at this profile; these types of devices may include, but are not limited to the following:

- Bridges (Mapping devices between ecosystems handling virtual devices from different ecosystems)
- Resource Directories (Devices trusted to manage OCF Security Domain resources)
- Remote Access (Devices which have external access but can also act within the OCF Security Domain)
- Healthcare Devices (Devices with specific requirements for enhanced security and privacy)
Industrial Devices (Devices with advanced management, security and attestation requirements)

14.8.3.4.3 Requirements for Certification at Security Profile Black (Normative)

Every device with "currentprofile" Property of the "/oic/sec/sp" Resource designating a Security Profile of "sp-black-v0", as defined in clause 14.8.2, must support each of the following:

- Onboarding via OCF Rooted Certificate Chain, including PKI chain validation
- Support for AES 128 encryption for data at rest and in transit.
- Hardening minimums: manufacturer assertion of secure credential storage
- In – in enumerated item #10 "The "/oic/sec/cred" Resource should contain credential(s) if required by the selected OTM" is changed to require the credential be stored: "The "/oic/sec/cred" Resource shall contain credential(s)."
- The OCF Device shall include an X.509v3 OCF Compliance Extension (clause 9.4.2.2.4) in its certificate and the extension's 'securityProfile' field shall contain sp-black-v0 represented by the ocfSecurityProfileOID string, "1.3.6.1.4.1.51414.0.0.2.0".

When a device supports the black profile, the "supportedprofiles" Property shall contain sp-black-v0, represented by the OID string "1.3.6.1.4.1.51414.0.0.2.0", and may contain other profiles.

When a manufacturer makes sp-black-v0 the default, by setting the "currentprofile" Property to "1.3.6.1.4.1.51414.0.0.2.0", the "supportedprofiles" Property shall contain sp-black-v0.

The OCF Rooted Certificate Chain and PKI is defined by and structured within a framework described in the supporting documents:

- Certificate Profile (See 9.4.2)

14.8.3.5 Security Profile Blue v0 (sp-blue-v0)

14.8.3.5.1 Blue Profile General

The Security Profile Blue is used when manufacturers issue platform certificates for platforms containing manufacturer-embedded keys. Compatibility with interoperable trusted platforms is anticipated using certificate extensions defined by the Trusted Computing Group (TCG). OCF Security Domain owners evaluate manufacturer supplied certificates and attributed data to determine an appropriate OCF Security Profile that is configured for OCF Devices at onboarding. OCF Devices may satisfy multiple OCF Security Profiles. The OCF Security Domain owner may configure deployments using the Security Profile as OCF Security Domain partitioning criteria.

Certificates issued to Blue Profile Devices shall be issued by a CA conforming to the CA Vetting Criteria defined by OCF.

14.8.3.5.2 Platforms and Devices for Security Profile Blue v0

The OCF Security Profile Blue anticipates an ecosystem where platform vendors may differ from OCF Device vendor and where platform vendors may implement trusted platforms that may conform to industry standards defining trusted platforms. The OCF Security Profile Blue specifies mechanisms for linking platforms with OCF Device(s) and for referencing quality assurance criteria produced by OCF conformance operations. The OCF Security Domain owner evaluates these data when an OCF Device is onboarded into the OCF Security Domain. Based on this evaluation the OCF Security Domain owner determines which Security Profile may be applied during OCF Device operation. All OCF Device types may be considered for evaluation using the OCF Security Profile Blue.
14.8.3.5.3 Requirements for Certification at Security Profile Blue v0

The OCF Device satisfies the Blue profile v0 (sp-blue-v0) when all of the security normative for this document version are satisfied and the following additional criteria are satisfied.

OCF Blue profile defines the following OCF Device quality assurances:

- The OCF Conformance criteria shall require vendor attestation that the conformant OCF Device was hosted on one or more platforms that satisfies OCF Blue platform security assurances and platform security and privacy functionality requirements.
- The OCF Device achieving OCF Blue Security Profile compliance will be registered by OCF and published by OCF in a machine readable format.
- The OCF Blue Security Profile compliance registry may be digitally signed by an OCF owned signing key.
- The OCF Device shall include an X.509v3 OCF Compliance Extension (clause 9.4.2.2.4) in its certificate and the extension's 'securityProfile' field shall contain sp-blue-v0 represented by the ocfSecurityProfileOID string, "1.3.6.1.4.1.51414.0.0.3.0".
- The OCF Device shall include an X.509v3 OCF CPL Attributes Extension (clause 9.4.2.2.7) in its certificate.
- The DOTS is expected to perform a lookup of the certification status of the OCF Device using the OCF CPL Attributes Extension values and verify that the sp-blue-v0 OID is listed in the extension's "securityprofiles" field.

OCF Blue profile defines the following OCF Device security functionality:

- OCF Device(s) shall be hosted on a platform where a cryptographic and secure storage functions are hardened by the platform.
- OCF Device(s) hosted on a platform shall expose accompanying manufacturer credentials using the "/oic/sec/cred" Resource where the "credusage" Property contains the value "oic.sec.cred.mfgcert".
- OCF Device(s) that are hosted on a TCG-defined trusted platform should use an IEEE802.1AR IDevID and should verify the "TCG Endorsement Key Credential". All TCG-defined manufacturer credentials may be identified by the "oic.sec.cred.mfgcert" value of the "credusage" Property of the "/oic/sec/cred" Resource. They may be used in response to selection of the "oic.sec.doxm.mfgcert" owner transfer method.
- OCF Device(s) shall use AES128 equivalent minimum protection for transmitted data. (See NIST SP 800-57).
- OCF Device(s) shall use AES128 equivalent minimum protection for stored data. (See NIST SP 800-57).
- OCF Device(s) should use AES256 equivalent minimum protection for stored data. (See NIST SP 800-57).
- OCF Device(s) should protect the "/oic/sec/cred" resource using the platform provided secure storage.
- OCF Device(s) shall protect trust anchors (aka policy defining trusted CAs and pinned certificates) using platform provided secure storage.
- OCF Device(s) should check certificate revocation status for locally issued certificates.
- The DOTS is expected to check certificate revocation status for all certificates in manufacturer certificate path(s) if available. If a certificate is revoked, certificate validation fails and the connection is refused. The DOTS may disregard revocation status results if unavailable.

OCF Blue profile defines the following platform security assurances:
Platforms implementing cryptographic service provider (CSP) functionality and secure storage functionality should be evaluated with a minimum FIPS140-2 Level 2 or Common Criteria EAL Level 2.

Platforms implementing trusted platform functionality should be evaluated with a minimum Common Criteria EAL Level 1.

OCF Blue profile defines the following platform security and privacy functionality:

- The Platform shall implement cryptographic service provider (CSP) functionality.
- Platform CSP functionality shall include cryptographic algorithms, random number generation, secure time.
- The Platform shall implement AES128 equivalent protection for transmitted data. (See NIST SP 800-57).
- The Platform shall implement AES128 and AES256 equivalent protection for stored data. (See NIST SP 800-57).
- Platforms hosting OCF Device(s) should implement a platform identifier following IEEE802.1AR or Trusted Computing Group (TCG) specifications.
- Platforms based on Trusted Computing Group (TCG) platform definition that host OCF Device(s) should supply TCG-defined manufacture certificates; also known as “TCG Endorsement Key Credential” (which complies with IETF RFC 5280) and “TCG Platform Credential” (which complies with IETF RFC 5755).

When a device supports the Blue profile, the "supportedprofiles" Property shall contain sp-blue-v0, represented by the OID string "1.3.6.1.4.1.51414.0.0.3.0", and may contain other profiles.

When a manufacturer makes sp-blue-v0 the default, by setting the "currentprofile" Property to "1.3.6.1.4.1.51414.0.0.3.0", the "supportedprofiles" Property shall contain sp-blue-v0.

During onboarding, while the device state is RFOTM, the DOTS may update the "currentprofile" Property to one of the other values found in the "supportedprofiles" Property.

14.8.3.6 Security Profile Purple v0 (sp-purple-v0)

Every device with the "/oic/sec/sp" Resource designating "sp-purple-v0", as defined in clause 14.8.2 must support following minimum requirements

- Hardening minimums: secure credential storage, software integrity validation, secure update.
- If a Certificate is used, the OCF Device shall include an X.509v3 OCF Compliance Extension (clause 9.4.2.2.4) in its certificate and the extension's 'securityProfile' field shall contain sp-purple-v0 represented by the ocfSecurityProfileOID string, "1.3.6.1.4.1.51414.0.0.4.0"
- The OCF Device shall include a X.509v3 OCFCPLAttributes Extension (clause 9.4.2.2.7) in its End-Entity Certificate when manufacturer certificate is used.

Security Profile Purple has following optional security hardening requirements that the device can additionally support.

- Hardening additions: secure boot, hardware backed secure storage
- The OCF Device shall include a X.509v3 OCFSecurityClaims Extension (clause 9.4.2.2.6) in its End-Entity Certificate and it shall include corresponding OIDs to the hardening additions implemented and attested by the vendor. If there is no additional support for hardening requirements, X.509v3 OCFSecurityClaims Extension shall be omitted.

For software integrity validation, OCF Device(s) shall provide the integrity validation mechanism for security critical executables such as cryptographic modules or secure service applications, and they should be validated before the execution. The key used for validating the integrity must be pinned at the least to the validating software module.
For secure update, OCF Device(s) shall be able to update its firmware in a secure manner.

For secure boot, OCF Device(s) shall implement the BIOS code (first-stage bootloader on ROM) to be executed by the processor on power-on, and secure boot parameters to be provisioned by tamper-proof memory. Also OCF Device(s) shall provide software module authentication for the security critical executables and stop the boot process if any integrity of them is compromised.

For hardware backed secure storage, OCF Device(s) shall store sensitive data in non-volatile memory ("NVRAM") and prevent the retrieval of sensitive data through physical and/or electronic attacks.

More details on security hardening guidelines for software integrity validation, secure boot, secure update, and hardware backed secure storage are described in 14.3, 14.5 and 14.2.2.2.

Certificates issued to Purple Profile Devices shall be issued by a CA conforming to the CA Vetting Criteria defined by OCF.

When a device supports the purple profile, the "supportedprofiles" Property shall contain sp-purple-v0, represented by the OID string "1.3.6.1.4.1.51414.0.0.4.0", and may contain other profiles.

When a manufacturer makes sp-purple-v0 the default, by setting the "currentprofile" Property to "1.3.6.1.4.1.51414.0.0.4.0", the "supportedprofiles" Property shall contain sp-purple-v0.
15 Device Type Specific Requirements

15.1 Bridging Security

15.1.1 Universal Requirements for Bridging to another Ecosystem

The Bridge shall go through OCF ownership transfer as any other onboardee would.

The software of a Bridge shall be field updatable. (This requirement need not be tested but can be certified via a vendor declaration.)

Each VOD shall be onboarded by an OCF OBT. Each Virtual Bridged Device should be provisioned as appropriate in the Bridged Protocol. In other words, VODs and Virtual Bridged Devices are treated the same way as physical Devices. They are entities that have to be provisioned in their network.

Each VOD shall implement the behaviour required by ISO/IEC 30118-1:2018 and this document. Each VOD shall perform authentication, access control, and encryption according to the security settings it received from the OCF OBT. Each Virtual Bridged Device shall implement the security requirements of the Bridged Protocol.

In addition, in order to be considered secure from an OCF perspective, the Bridge Platform shall use appropriate ecosystem-specific security options for communication between the Virtual Bridged Devices instantiated by the Bridge and Bridged Devices. This security shall include mutual authentication, and encryption and integrity protection of messages in the bridged ecosystem.

A VOD may authenticate itself to the DOTS using the Manufacturer Certificate Based OTM (see clause 7.3.6) with the Manufacturer Certificate and corresponding private key of the Bridge which instantiated that VOD.

A VOD may authenticate itself to the OCF Cloud using the Manufacturer Certificate and corresponding private key of the Bridge which instantiated that VOD.

A Bridge and the VODs created by that Bridge shall operate as independent Devices, with the following exceptions:

- If a Bridge creates a VOD while the Bridge is in an Unowned State, then the VOD shall be created in an Unowned State.
- An Unowned VOD shall not accept DTLS connection attempts nor TLS connection attempts nor any other requests, including discovery requests, while the Bridge (that created that VOD) is Unowned.
- At any time when a Bridge is transitioning from Owned to Unowned State, all Unowned VODs (created by that Bridge prior to the transition) shall drop any existing TLS and/or DTLS connections.
- At any time when a Bridge is transitioning from Unowned to Owned State, the Bridge shall trigger all Unowned VODs (created by that Bridge prior to the transition) to become accessible in RFOTM state, with internal state as if the VOD has just transitioned from RESET to RFOTM.
- If a Bridge creates a VOD while the Bridge is in an Owned State, then the VOD shall become accessible in RFOTM state, with internal state as if the VOD has just transitioned from RESET to RFOTM.

Table 60 intends to clarify this behaviour.
Table 60 – Dependencies of VOD Behaviour on Bridge state, as clarification of accompanying text

<table>
<thead>
<tr>
<th>Bridge state</th>
<th>Additional dependencies on VOD behaviour</th>
</tr>
</thead>
<tbody>
<tr>
<td>VOD is Unowned (either just created, or created previously)</td>
<td>VOD is Owned</td>
</tr>
<tr>
<td>From unboxing Bridge until just prior to the end of transition of Bridge from Unowned to Owned</td>
<td>No accepting DTLS connection attempts nor TLS connection attempts nor any other requests, including discovery requests</td>
</tr>
<tr>
<td>At end of transition from Unowned to Owned</td>
<td>VOD becomes accessible in RFOTM following Bridge's transition. Internal state as if just transitioned from RESET.</td>
</tr>
<tr>
<td>Owned</td>
<td>As per normal Device</td>
</tr>
<tr>
<td>At Start of transition from Owned to Unowned</td>
<td>Drop any established TLS/DTLS connections, even if already partway through Device ownership</td>
</tr>
<tr>
<td>Start of transition from Owned to Unowned, until just prior to the end of transition from Unowned to Owned.</td>
<td>No accepting DTLS connection attempts nor TLS connection attempts nor any other requests, including discovery requests</td>
</tr>
</tbody>
</table>

The "vods" Property of the "oic.r.vodlist" Resource on a Bridge reflects the details of all currently Owned VODs which have been created by that Bridge since the most recent hardware reset (if any) of the Bridge Platform (which removes all the created VODs), regardless of whether the VODs have the same owner as the Bridge or not. The entries in the "vods" Property are added and removed according to the following criteria:

- Whenever a VOD created by a Bridge transitions from being Unowned to being Owned, then an entry for that VOD shall be added to the "vods" Property of the "oic.r.vodlist" Resource of that Bridge.
- Whenever a VOD created by a Bridge transitions from being Owned to being Unowned, then entry for that VOD shall be removed from the "vods" Property of the "oic.r.vodlist" Resource of that Bridge. If that Bridge is currently in Unowned state, then the "oic.r.vodlist" Resource is not accessible, and the entry for that VOD shall be removed from the "vods" Property before or during the transition of that Bridge to the Owned state.
- All other modifications of the list are not allowed.

A Bridge shall only expose a secure OCF Endpoint for the "oic.r.vodlist" Resource.

15.1.2 Additional Security Requirements specific to Bridged Protocols

15.1.2.1 Additional Security Requirements specific to the AllJoyn Protocol

For AllJoyn translator, an authenticated and authorized Client shall be able to block the communication of all OCF Devices with all Bridged Devices that don’t communicate securely with the Bridge, by using the Bridge Device’s "oic.r.securemode" Resource specified in ISO/IEC 30118-4:2018.

15.1.2.2 Additional Security Requirements specific to the Bluetooth LE Protocol

A Bridge shall block the communication of all OCF Devices with all Bridged Devices that don’t communicate securely with the Bridge.

15.1.2.3 Additional Security Requirements specific to the oneM2M Protocols

The Bridge shall implement oneM2M application access control as defined in the oneM2M Release 3 Specifications.

An Bridge shall block the communication of all OCF Devices with all Bridged Devices that don't communicate securely with the Bridge.
15.1.2.4 Additional Security Requirements specific to the U+ Protocol
A Bridge shall block the communication of all OCF Devices with all Bridged Devices that don't communicate securely with the Bridge.

15.1.2.5 Additional Security Requirements specific to the Z-Wave Protocol
A Bridge shall block the communication of all OCF Devices with all Bridged Devices that don't communicate securely with the Bridge.

15.1.2.6 Additional Security Requirements specific to the Zigbee Protocol
A Bridge shall block the communication of all OCF Devices with all Bridged Devices that don't communicate securely with the Bridge.

15.1.2.7 Additional Security Requirements specific to the EnOcean Radio Protocol
A Bridge shall block the communication of all OCF Devices with all Bridged Devices that don't communicate securely with the Bridge.
Annex A
(informative)
Access Control Examples

Example OCF ACL Resource

Figure A-1 shows how a "/oic/sec/acl2" Resource could be configured to enforce an example access policy on the Server.

```json
{
    "aclist2": [
        {
            "subject": {"uuid": "XXXX-...-XX01"},
            "resources": [
                {"href": "/oic/sh/light/1"},
                {"href": "/oic/sh/temp/0"}
            ],
            "permission": 31, // 31 dec = 0b0001 1111 which maps to ---N DURC
            "validity": [
                // The period starting at 18:00:00 UTC, on January 1, 2015 and ending at 07:00:00 UTC on January 2, 2015
                "period": ["20150101T180000Z/20150102T070000Z"],
                // Repeats the {period} every week until the last day of Jan. 2015.
                "recurrence": ["RRULE:FREQ=WEEKLY;UNTIL=20150131T070000Z"]
            ],
            "aceid": 1
        }
    ],
    // An ACL provisioning and management service should be identified as
    // the resource owner
    "rowneruuid": "0685B960-736F-46F7-BEC0-9E6CBD61ADC1"
}
```

Figure A-1 – Example "/oic/sec/acl2" Resource
Given that IoT verticals and Devices will not be of uniform capabilities, a one-size-fits all security robustness requirements meeting all IOT applications and services will not serve the needs of OCF, and security profiles of varying degree of robustness (trustworthiness), cost and complexity have to be defined. To address a large ecosystem of vendors, the profiles can only be defined as requirements and the exact solutions meeting those requirements are specific to the vendors’ open or proprietary implementations, and thus in most part outside scope of this document.

To align with the rest of OCF documents, where Device classifications follow IETF RFC 7228 (Terminology for constrained node networks) methodology, we limit the number of security profiles to a maximum of 3 (see Table B.1). However, our understanding is OCF capabilities criteria for each of 3 classes will be more fit to the current IoT chip market than that of IETF.

Given the extremely low level of resources at class 0, our expectation is that class 0 Devices are either capable of no security functionality or easily breakable security that depend on environmental (e.g. availability of human) factors to perform security functions. This means the class 0 will not be equipped with an SEE.

### Table B.1 – OCF Security Profile

<table>
<thead>
<tr>
<th>Platform class</th>
<th>SEE</th>
<th>Robustness level</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>No</td>
<td>N/A</td>
</tr>
<tr>
<td>1</td>
<td>Yes</td>
<td>Low</td>
</tr>
<tr>
<td>2</td>
<td>Yes</td>
<td>High</td>
</tr>
</tbody>
</table>

NOTE: This analysis acknowledges that these Platform classifications do not take into consideration of possibility of security co-processor or other hardware security capability that augments classification criteria (namely CPU speed, memory, storage).

</tbody>
</table>

C.2 Access Control List-2

C.2.1 Introduction

This Resource specifies the local access control list.
When used without query parameters, all the ACE entries are returned.
When used with a query parameter, only the ACEs matching the specified parameter are returned.

C.2.2 Well-known URI

/oic/sec/acl2

C.2.3 Resource type

The Resource Type is defined as: "oic.r.acl2".

C.2.4 OpenAPI 2.0 definition

C.2.5 Property definition

Table C-1 defines the Properties that are part of the "oic.r.acl2" Resource Type.

Table C-1 – The Property definitions of the Resource with type "rt" = "oic.r.acl2".

<table>
<thead>
<tr>
<th>Property name</th>
<th>Value type</th>
<th>Mandatory</th>
<th>Access mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rowneruuid</td>
<td>string</td>
<td>Yes</td>
<td>Read Write</td>
<td>The value identifies the unique Resource owner Format pattern</td>
</tr>
</tbody>
</table>
C.2.6 CRUDN behaviour

Table C-2 defines the CRUDN operations that are supported on the "oic.r.acl2" Resource Type.

<table>
<thead>
<tr>
<th>Create</th>
<th>Read</th>
<th>Update</th>
<th>Delete</th>
<th>Notify</th>
</tr>
</thead>
<tbody>
<tr>
<td>get</td>
<td>post</td>
<td>delete</td>
<td></td>
<td>observe</td>
</tr>
</tbody>
</table>

C.3 Credential

C.3.1 Introduction

This Resource specifies credentials a Device may use to establish secure communication. Retrieves the credential data. When used without query parameters, all the credential entries are returned. When used with a query parameter, only the credentials matching the specified parameter are returned.

Note that write-only credential data will not be returned.

C.3.2 Well-known URI

/oic/sec/cred

C.3.3 Resource type

The Resource Type is defined as: "oic.r.cred".

C.3.4 OpenAPI 2.0 definition

```json

deviceuuid  string  Read Write  The uuid formatted identity of the Device Format pattern according to IETF RFC 4122.

owned  boolean  Read Write  Ownership status flag.

oxmsel  integer  Read Write  The selected owner transfer method used during on-boarding. The Device owner transfer methods that may be selected at Device on-boarding. Each value indicates a specific Owner Transfer method:

0 - Numeric OTM identifier for the Just-Works method (oic.sec.doxm.jw)
1 - Numeric OTM identifier for the random PIN method (oic.sec.doxm.rdp)
2 - Numeric OTM identifier for the manufacturer certificate method (oic.sec.doxm.mfgcert)
3 - Numeric OTM identifier for the decap method (oic.sec.doxm.dcap) (deprecated).

C.5.6  CRUDN behaviour

Table C-8 defines the CRUDN operations that are supported on the "oic.r.doxm" Resource Type.

Table C-8 – The CRUDN operations of the Resource with type "rt" = "oic.r.doxm".

</tr>
</tbody>
</table>

**Resource owner**

Format pattern according to IETF RFC 4122.

**Resource Type of the Resource.**

**Current operational mode**

Device provisioning operation may be server directed or client (aka provisioning service) directed. The value is a bitmask encoded as integer and indicates the provisioning operation modes:

1 - Server-directed utilizing multiple provisioning services
2 - Server-directed utilizing a single provisioning service
4 - Client-directed provisioning
8 - Unused
16 - Unused
32 - Unused
64 - Unused
128 - Unused.

**Current Device provisioning mode**

Device provisioning mode maintains a bitmask of the possible provisioning states of a Device. The value can be either 8 or 16 character in length. If its only 8 characters it represents the lower byte value:

1 - Manufacturer reset state
2 - Device pairing and owner transfer state
4 - Provisioning of credential management services
8 - Provisioning of access management services
16 - Provisioning of access management services
32 - Provisioning of local ACLs
64 - Initiate Software Version Validation
128 - Initiate Secure Software Update.
<table>
<thead>
<tr>
<th>id</th>
<th>multiple types: see schema</th>
<th>No</th>
<th>Read Write</th>
</tr>
</thead>
<tbody>
<tr>
<td>isop</td>
<td>boolean</td>
<td>Yes</td>
<td>Read Only</td>

<td>object: see schema</td>
<td>Yes</td>
<td>Read Write</td>
</tr>
</tbody>
</table>

**isop**
- **Type**: boolean
- **Read/Write**: Yes
- **Property**: Read Only
- **Description**: true indicates Device is operational.

**tm**
- **Type**: integer
- **Read/Write**: Yes
- **Property**: Read Write
- **Description**: Target Device provisioning mode. Device provisioning mode maintains a bitmask of the possible provisioning states of a Device. The value can be either 8 or 16 character in length. If its only 8 characters it represents the lower byte value:
  - 1: Manufacturer reset state
  - 2: Device pairing and owner transfer state
  - 4: Unused
  - 8: Provisioning of credential management services
  - 16: Provisioning of access management services
  - 32: Provisioning of local ACLs
  - 64: Initiate Software Version Validation
  - 128: Initiate Secure Software Update.

**sm**
- **Type**: integer
- **Read/Write**: Yes
- **Property**: Read Only
- **Description**: Supported operational modes. Device provisioning operation may be server directed or client (aka provisioning service) directed. The value is a bitmask encoded as integer and indicates the provisioning operation modes:
  - 1: Server-directed utilizing multiple provisioning services
  - 2: Server-directed utilizing a single provisioning service
  - 4: Client-directed provisioning
  - 8: Unused
  - 16: Unused
  - 32: Unused
  - 64: Unused
  - 128: Unused.
<table>

C.10 Security Domain Information

C.10.1 Introduction
This Resource contains the information that identifies the OCF Security Domain to which the device belongs.

C.10.2 Well-known URI
/oic/sec/sdi

C.10.3 Resource type
The Resource Type is defined as: "oic.r.sdi".

C.10.4 OpenAPI 2.0 definition

Annex D
(informative)

OID definitions

This annex captures the OIDs defined throughout the document. The OIDs listed are intended to be used within the context of an X.509 v3 certificate. MAX is an upper bound for SEQUENCES of UTF8Strings and OBJECT IDENTIFIERS and should not exceed 255.

id-OCF OBJECT IDENTIFIER ::= { iso(1) identified-organization(3) dod(6) internet(1) private(4) enterprise(1) OCF(51414) }

-- OCF Security specific OIDs

id-ocfSecurity OBJECT IDENTIFIER ::= { id-OCF 0 }
id-ocfX509Extensions OBJECT IDENTIFIER ::= { id-OCF 1 }

-- OCF Security Categories

id-ocfSecurityProfile ::= { id-ocfSecurity 0 }

Annex E  
(informative)

Security considerations specific to Bridged Protocols

The text in this Annex is provided for information only. This Annex has no normative impact. This information is applicable at the time of initial publication and may become out of date.

E.1 Security Considerations specific to the AllJoyn Protocol

This clause intentionally left empty.

E.2 Security Considerations specific to the Bluetooth LE Protocol

BLE GAP supports two security modes, security mode 1 and security mode 2. Each security mode has several security levels (see Table E.1)

Security mode 1 and Security level 2 or higher would typically be considered secure from an OCF perspective. The appropriate selection of security mode and level is left to the vendor.

<table>
<thead>
<tr>
<th>GAP security mode</th>
<th>security level</th>
</tr>
</thead>
<tbody>
<tr>
<td>Security mode 1</td>
<td>1 (no security)</td>
</tr>
<tr>
<td></td>
<td>2 (Unauthenticated pairing with encryption)</td>
</tr>
<tr>
<td></td>
<td>3 (Authenticated pairing with encryption)</td>
</tr>
<tr>
<td></td>
<td>4 (Authenticated LE Secure Connections pairing with encryption)</td>
</tr>
<tr>
<td>Security mode 2</td>
<td>1 (Unauthenticated pairing with data signing)</td>
</tr>
<tr>
<td></td>
<td>2 (Authenticated pairing with data signing)</td>
</tr>
</tbody>
</table>

Figure E-1 shows how communications in both ecosystems of OCF-BLE Bridge Platform are secured by their own security.

E.3 Security Considerations specific to the oneM2M Protocol

This clause intentionally left empty.
E.4 Security Considerations specific to the U+ Protocol

A U+ server supports one of the TLS 1.2 cipher suites as in Table E.2 defined in IETF RFC 5246.

<table>
<thead>
<tr>
<th>Cipher Suite</th>
</tr>
</thead>
<tbody>
<tr>
<td>TLS_RSA_WITH_AES_128_CBC_SHA256</td>
</tr>
<tr>
<td>TLS_RSA_WITH_AES_256_CBC_SHA256</td>
</tr>
<tr>
<td>TLS_RSA_WITH_AES_256_CCM</td>
</tr>
<tr>
<td>TLS_RSA_WITH_AES_256_CCM_8</td>
</tr>
<tr>
<td>TLS_RSA_WITH_AES_256_GCM_SHA384</td>
</tr>
<tr>
<td>TLS_DHE_RSA_WITH_AES_256_CBC_SHA256</td>
</tr>
<tr>
<td>TLS_DHE_RSA_WITH_AES_256_GCM_SHA384</td>
</tr>
<tr>
<td>TLS_ECDH_ECDSA_WITH_AES_256_CBC_SHA384</td>
</tr>
<tr>
<td>TLS_ECDH_ECDSA_WITH_AES_256_GCM_SHA384</td>
</tr>
<tr>
<td>TLS_ECDH_RSA_WITH_AES_256_CBC_SHA384</td>
</tr>
<tr>
<td>TLS_ECDH_RSA_WITH_AES_256_GCM_SHA384</td>
</tr>
<tr>
<td>TLS_ECDHE_ECDSA_WITH_AES_256_CBC_SHA384</td>
</tr>
<tr>
<td>TLS_ECDHE_ECDSA_WITH_AES_256_CCM</td>
</tr>
<tr>
<td>TLS_ECDHE_ECDSA_WITH_AES_256_CCM_8</td>
</tr>
<tr>
<td>TLS_ECDHE_ECDSA_WITH_AES_256_GCM_SHA384</td>
</tr>
<tr>
<td>TLS_ECDHE_RSA_WITH_AES_256_CBC_SHA384</td>
</tr>
<tr>
<td>TLS_ECDHE_RSA_WITH_AES_256_GCM_SHA384</td>
</tr>
<tr>
<td>TLS_DHE_RSA_WITH_AES_256_CCM</td>
</tr>
<tr>
<td>TLS_DHE_RSA_WITH_AES_256_GCM</td>
</tr>
</tbody>
</table>

The security of the Haier U+ Protocol is proprietary, and further details are presently unavailable.

E.5 Security Considerations specific to the Z-Wave Protocol

Z-Wave currently supports two kinds of security class which are S0 Security Class and S2 Security Class, as shown in Table E.3. Bridged Z-wave Servers using S2 Security Class for communication with a Virtual Bridged Client would typically be considered secure from an OCF perspective. The appropriate selection for S2 Security Class and Class Name is left to the vendor.

Figure E-2 presents how OCF Client and Bridged Z-Wave Server communicate based upon their own security.
All 3 types of S2 Security Class such as S2 Access Control, S2 Authenticated and S2 Unauthenticated provides the following advantages from the security perspective:

- The unique device specific key for every secure device enables validation of device identity and prevents man-in-the-middle compromises to security
- The Secure cryptographic key exchange methods during inclusion achieves high level of security between the Virtual Z-Wave Client and the Bridged Z-Wave Server.
- Out of band key exchange for product authentication which is combined with device specific key prevents eavesdropping and man-in-the-middle attack vectors.

See Table E.3 for a summary of Z-Wave Security Classes.

<table>
<thead>
<tr>
<th>Security Class</th>
<th>Class Name</th>
<th>Validation of device identity</th>
<th>Key Exchange</th>
<th>Message Encapsulation</th>
</tr>
</thead>
<tbody>
<tr>
<td>S2</td>
<td>S2 Access Control</td>
<td>Device Specific key</td>
<td>Out-of-band inclusion</td>
<td>Encrypted command transmission</td>
</tr>
<tr>
<td>S2</td>
<td>S2 Authenticated</td>
<td>Device Specific key</td>
<td>Out-of-band inclusion</td>
<td>Encrypted command transmission</td>
</tr>
<tr>
<td>S2</td>
<td>S2 Unauthenticated</td>
<td>Device Specific key</td>
<td>Z-wave RF band used for inclusion</td>
<td>Encrypted command transmission</td>
</tr>
<tr>
<td>S0</td>
<td>S0 Authenticated</td>
<td>N/A</td>
<td>Z-wave RF band used for inclusion</td>
<td>Encrypted command transmission</td>
</tr>
</tbody>
</table>

On the other hand, S0 Security Class has the vulnerability of security during inclusion by exchanging of temporary 'well-known key' (e.g. 1234). As a result of that, it could lead the disclosure of the network key if the log of key exchange methods is captured, so Z-Wave devices might be no longer secure in that case.

E.6 Security Considerations specific to the Zigbee Protocol

The Zigbee 3.0 stack supports multiple security levels. A security level is supported by both the network (NWK) layer and application support (APS) layer. A security attribute in the Zigbee 3.0 stack, "nwkSecurityLevel", represents the security level of a device.
The security level nwkSecurityLevel > 0x04 provides message integrity code (MIC) and/or AES128-CCM encryption (ENC). Zigbee Servers using nwkSecurityLevel > 0x04 would typically be considered secure from an OCF perspective. The appropriate selection for nwkSecurityLevel is left to the vendor.

See Table E.4 for a summary of the Zigbee Security Levels.

**Table E.4 Zigbee 3.0 Security Levels to the Network, and Application Support layers**

<table>
<thead>
<tr>
<th>Security Level Identifier</th>
<th>Security Level Sub-Field</th>
<th>Security Attributes</th>
<th>Data Encryption</th>
<th>Frame Integrity (Length of M of MIC, in Number of Octets)</th>
</tr>
</thead>
<tbody>
<tr>
<td>0x00</td>
<td>'000'</td>
<td>None</td>
<td>OFF</td>
<td>NO (M=0)</td>
</tr>
<tr>
<td>0x01</td>
<td>'001'</td>
<td>MIC-32</td>
<td>OFF</td>
<td>YES(M=4)</td>
</tr>
<tr>
<td>0x02</td>
<td>'010'</td>
<td>MIC-64</td>
<td>OFF</td>
<td>YES(M=8)</td>
</tr>
<tr>
<td>0x03</td>
<td>'011'</td>
<td>MIC-128</td>
<td>OFF</td>
<td>YES(M=16)</td>
</tr>
<tr>
<td>0x04</td>
<td>'100'</td>
<td>ENC</td>
<td>ON</td>
<td>NO(M=0)</td>
</tr>
<tr>
<td>0x05</td>
<td>'101'</td>
<td>ENC-MIC-32</td>
<td>ON</td>
<td>YES(M=4)</td>
</tr>
<tr>
<td>0x06</td>
<td>'110'</td>
<td>ENC-MIC-64</td>
<td>ON</td>
<td>YES(M=8)</td>
</tr>
<tr>
<td>0x07</td>
<td>'111'</td>
<td>ENC-MIC-128</td>
<td>ON</td>
<td>YES(M=16)</td>
</tr>
</tbody>
</table>

Figure E-3 shows how communications in both ecosystems of OCF-Zigbee Bridge Platform are secured by their own security.

**Figure E-3 Security Considerations for Zigbee Bridge**

### E.7 Security Considerations specific to the EnOcean Radio Protocol

The EnOcean Radio Protocol supports four different security levels. The security level depends on which security mechanisms are used. Table E.5 defines them.

**Table E.5 EnOcean Radio Protocol security levels**

<table>
<thead>
<tr>
<th>Level</th>
<th>Features</th>
<th>Replay Attack Vulnerability</th>
<th>Eavesdropping Vulnerability</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>No Features (Unsecure)</td>
<td>Yes</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td>With Encryption only</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>---</td>
<td>---------------------</td>
<td>-----</td>
<td>----</td>
</tr>
<tr>
<td>2</td>
<td>Without Encryption but with RLC and CMAC</td>
<td>No</td>
<td>Yes</td>
</tr>
<tr>
<td>3</td>
<td>With Encryption, RLC and CMAC</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

The security levels 1 and 2 have been declared deprecated and shall not longer be used. Security level 3 uses Variable AES Encryption, Rolling Code (RLC) and a cipher-based message authentication code (CMAC) with private keys and public vectors. Technically each feature can be combined with every other feature, even if it is obsolete or unreasonable.

Figure E-4 shows how communications in both ecosystems of OCF-EnOcean Bridge Platform are secured by their own security.
